NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

I flew from my home ranch strip to S73 to pick up a passenger and obtain fuel shortly after daybreak. Conditions were ideal for early morning flight although there was a smoke haze at 4000' over the local area to the south of S73 due to local Forest Fires. N910MK was built with two extra fuel shutoff valves just inboard of the wing roots. I turned those valves to off to prevent cross feeding while fueling. After fueling with 100LL we loaded up and prepared to depart. However my passenger stated he had forgotten his sunglasses. He deplaned to retrieve them. After getting back in the aircraft we then taxied to runway 32 where I did the usual runup and mag check. I verified that the main fuel valve was in the on position but neglected to check the two wing tank valves. At this point we had been running on the fuel contained in the header tank approx. 1.5 gal. I began the take off roll rotated at approx 300' and began to climb. At approx midfield and 200+ altitude the engine coughed and began to sputter. I established best glide attempted to restart and even turned on valve back on. But by that time had run out of time and distance. The engine was starting to catch but would not have given enough climb to clear more than half way up the trunks of the cottonwood trees off of the north end of the runway. I slipped the plane down to 10-15' and attempted a left turn towards the only open field available. I was too low to make the turn and struck the left wing (at the end of 32 approx 70' from the end on the west edge) causing the airplane to do a semi flat cartwheel with the left side of the aircraft sustaining the majority of the impact and coming to rest pointing to the south and between the end of the runway and a gravel access road.. We were both able to exit the aircraft and proceed to the hangar to obtain fuel cans so as to siphon the fuel out of the tanks. Fuel was running out of the caps and over the wings down an incline away from the engine.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I had used a check list when I left my ranch strip but having no way to ensure that the list was visible I had placed it under the passenger seat cushion. Check list should be visible to pilot. Also, the two wing root fuel valves are behind the pilot and passenger sight line whereas the main valve is in the middle of the console. I am the third owner of this airplane and the plans do not call for shutoff valves other than one main valve on the console. At some point the extra valves were installed prior to my purchase. Clearly I thought I could manage the extra valves and just as clearly they were/are a link in the accident chain waiting to happen. I wasted precious time attempting to restart the engine, given the performance of this airplane had I immediately performed a forward slip the out come could have been much more favorable. More time should be devoted to real life emergency scenarios at longer fields practicing for this possibility.
