NARRATIVE TO FURTHER EXPLAIN AIRCRAFT ACCIDENT REPORT FOR THE AVEMCO
INSURANCE COMPANY

At about 1030 on the morning of Monday, 20 Oct. 2014 I taxied my LSA Thorpedo, N 211 MY, to the takeoff position for runway 10. As I approached the run-up position a white pick-up truck was parked in the run-up area. It was unoccupied and I saw nobody near it. I thought that it may have been left there because of mechanical difficulty or was out of gas. I decide to perform the run-up on the taxiway and then approach the run-up position to see if I could possible get by the truck to the runway. With run-up completed I started my reversal only to have my right gear leave the runway into the soft dirt .I didn't anticipate the drag of the soft shoulder. I added power to complete the turn. I added too much power, for as the wheel left the soft dirt restricting its movement and gained the smooth surface of the taxiway the aircraft accelerated immediately, directly toward the parked truck. I yanked the throttle back and grabbed for the hand brake. I was able the steer left enough to avoid head-on contact, but struck the rear of the truck about mid section of the right wing. The result was to break the left rear light and slightly dent the top of the fender of the truck, and to do substantial damage to aircraft right wing. The prop tips also hit the dirt as the aircraft left the taxiway. There was some damage to the bottom of the left wingtip as well. There may be more damage, but it will require expert analysis to fully assess.

Contributing factors in order of affect:

1. Truck abandoned on run-up area.
2. My decision to perform engine run-up on the taxiway.
3. Applying too much power to get the right gear back onto the taxiway.
4. The very short throttle movement required from idle to full throttle on this aircraft.
5. A hand brake vs. rudder pedal braking system, requiring release of the throttle to also apply brakes with the same hand, rather than reducing power and applying brakes simultaneously.
6. The softness of the soil on the taxiway shoulder due to very recent taxiway construction.
7. A quartering tailwind of 15 to 17 knots, helping to accelerate the aircraft as it regained the taxiway.
