**Description of Damage to Aircraft and Other Property** *(Use additional sheet if necessary)*

Aircraft was destroyed. Left and right canard sheared at fuselage. Right wing sheared at fuselage. Both engines sheared at fuselage. Canopy destroyed. Fuselage broken along fuselage stations in three places starting at the back of the pilots seat and the aft most break just forward of the vertical tail.

**NARRATIVE HISTORY OF FLIGHT** *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The biggest risk to the program was engine reliability (experimental engine). Engine reliability is the highest risk of the program because the engines are new and have not yet flown. The Quickie airframe was a natural choice because it's low drag meant that in a single engine situation it could climb on one engine, and if both engines were lost the glide ratio would also be favorable. From a procedural standpoint the decision was made to minimize power changes near the ground and in the event of an engine failure the second engine would be shut down and the airplane landed without power, likely straight ahead.

In the afternoon the winds were forecast to increase from calm to 25 knots out of the west. From 2:00 to 3:00 we watched the winds sit at roughly 100 degrees and 10 knots with gusts to 15, producing a 7 knot crosswind component (in the gust). There is no published crosswind limit for the Quickie in the POH. 5 knots crosswind was our company limit for the first flight only and we hoped to understand crosswind handling as soon as possible, to allow us to operate in Mojave. Shortly after takeoff (3:15) the ground crew informed me that the wind gust had increased significantly and the direction was shifting to from the West. I pulled the power back to idle and set up to land.

On short final to 12 I applied full crosswind controls and found they weren't enough to parallel the runway. I continued the descent, approaching at 70 MIAS, and setting up to land with a slight cross track diagonally across the runway. With five to ten feet to go, there was a large gust from the right that rolled the airplane left more than 45°. I decided to go around and selected full power.

Applying full power I heard the engines spool up, I felt the thrust push me back in my seat, and I pulled the nose up to climb attitude. I heard an engine quit, the engine monitor confirmed that the left engine (downwind) had shutdown and gone into cooldown mode. With the nose that high it took a while to see that the nose was slicing to the left. Rolled into the dead engine and pointed towards the 747s landing straight ahead was not an option. I distinctly remember thinking at this moment that this was a worst case scenario.

We had briefed that in the event of an engine failure the second engine would be shut off and the airplane landed straight ahead. Without a suitable landing spot in sight I kept the right engine powered up and attempted to climb. I reduced the right engine to less than forty percent (predicted PFLF) and then added and removed power working on the Lat/Dir problem that was pushing me into a downwind turn and the boneyard/747s. The airplane clearly needed more speed to become controllable but I couldn't climb high enough to lower the nose and accelerate. I could not raise the left wing and the airplane was consistently in a hard slip to the left with the nose slicing left. Once it became clear I wasn't going to get above the tails of the 747s I reduced power to get lat/dir control and between the tails. As I got through the tails and looked deeper into the boneyard, I was below everything in front of me (specifically a silver convair 880) and there was no open ground to land. I decided climbing was the only way I would survive. I added power, the slip got worse, the airplane stalled and rolled left. An abandoned mobile home sat in foreground in front of the broad side of two 747s that were much taller than I could climb. I accepted the mobilehome as a better accident site than the landing gear of an airliner and pulled the right engine back to idle. At this moment I remember feeling exhausted that the fight was over and relieved that the puzzle had been solved, no matter how bad the result.

I closed my eyes before impact. When I opened my eyes I was on the ground in the boneyard, canopy and visor were gone and the sudden change in sunlight was a surprise. I visually inspected the limbs that I could see. Then I moved my neck and back and felt nothing strange. I picked up my arms and visually inspected for blood. Then did the same for my legs. Finally I unlatched the seatbelt and stood up. Shortly after stepping out of the wreck Justin Gillen and the crew came around the corner in the chase truck. Airport security showed up roughly 5 minutes later. Ambulance after that, and then the fire department (drove from Cal City).

**RECOMMENDATION (How could this accident/incident have been prevented?)**

## Operator/Owner Safety Recommendation

The three major contributors to the accident were, first wind gusts, second engine reliability, and third VMCA being above VREF. As it was very early in the test program we had not begun to explore the VMCA characteristics, but we had confirmed that (due to the configuration) the airplane could not be landed faster than the design approach speed. Engine reliability was known to be a risk of the program, but the crosswind likely created unfavorable engine inlet induction angles. The engine manufacturer is looking into this.
