Subject : <No Subject>

On October the 8th before leaving the house I went to the FAA website and checked for NOTAM's and TFR's along the route for our flight. The only NOTAM of significance to our flight was the Idaho Falls automated weather was out of service. I also checked weather from several websites and determined the weather to be great for our planned trip to Tanner Ranch near Roberts Idaho and back that same day. We departed Twin Falls (TWF) at about 9:30 am for KJER to get fuel. We topped the tanks with 14.1 gallons of 100LL. We departed KJER and on climb out we contacted Boise Radio for winds aloft. The flight to Tanner was uneventful, all engine operating parameters were normal, fuel flow was normal, EGT's normal, oil pressure normal, coolant temps normal. All indications of engine operation were acceptable and in the normal range. The engine performed as expected. We landed at Tanner Ranch after 1.3 hours of flight time. We saw several friends, had lunch and decided to depart for home(TWF). There were several aircraft ahead of us for departure, when it was our turn we taxied back for a departure to the west. During the run-up I did notice a slight hesitation as I advanced the throttle. I attributed this to a possible vapor lock. I did a full power run-up with good results. I then did a full power run down the runway without taking off to check the engine operation. Everything appeared normal, we turned around and went back for the departure to the west. I did an additional run-up with normal indications. The take off acceleration was normal, the initial climb was normal. I had power set at approximately 37 inches and the rpms showed 5800 prior to lift off. After reaching about 100 feet AGL and just past the half way mark on the strip at 70 KTS indicated airspeed the engine began to lose power. The property is surrounded by fences and power lines, I did not have enough runway left to land straight ahead. I made a slight turn to the right, the engine was developing some power so I decided I could turn back and land in the opposite direction on the runway. During the turn, about half way thru the turn the engine began to rapidly lose power. I could not safely turn tight enough to make the runway. I was able to line up parallel to the runway and touch down in the sage brush approximately 200 feet south of the runway. The touchdown was normal, on rollout we hit a debris pit that was not visible until we were about 20 feet from it and I was unable to turn to avoid it. We hit the debris pit at an estimated speed of 15 to 20 mph and the aircraft was flipped upside down.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

I suspect possible carburetor malfunction, the carburetors were rebuilt by Rotax certified repair facility approx 35 hours ago by California Power Systems on May 4 2016 and installed on May 12 2016.
