Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

My background.

ATP SEL, SES, MEL

TT 19,946 hrs (including Alaska bush time).

Background.

In July 2016, the aircraft left Oshkosh for Renton, WA. En-route, during preflight in KMSO a nick was discovered on one of the blades of the left engine. I made the decision to not continue and have the nick on the composite blade repaired by Neptune, an FBO. Neptune repaired the blade according to the manufacturers recommendation. During this repair it was discovered that the left engine, left side manifold was cracked. I requested that it be repaired. A new manifold was fabricated, installed and signed off.

I attempted to continue the trip from KMSO to KRNT. The trip was not successful due to weather on Mulan pass. We went back to KMSO. After arrival at KMSO, during walk around another nick was discovered on one of the left engine blades. There was a fastener missing on the left engine cowling so we assume the fastener went through the pusher prop. This nick was larger and deeper. Neptune removed the prop on the left engine and shipped it to Northwest propellers, a certified repair station for MT-propellers. Northwest Propellers could not perform the repair and recommended that it be sent to the manufacturer. The 3 blades were removed from the hub and shipped to the manufacturer in Florida. After the repair the 3 blades were sent back to northwest propeller where they installed them back on the propeller hub. The assembly was then shipped to Neptune in Missoula and installed and signed off.

Emergency forced landing.

We arrived in Missoula on the evening of Jan 2nd. The aircraft had been in a heated hangar for approx 10 to 14 days. I checked the aircraft all over and was satisfied. Batteries were low, so I placed them on a charger. After the batteries were satisfactory, the aircraft was brought outside the hangar. I ran the engines and conducted checks of all the systems including the operation of the props. The aircraft was then put back into the hangar.

Next morning after the weather was determined to be satisfactory I ran the engines again for another check of the systems and all checks were satisfactory. The cabin heater was serviced with fuel. The fuel tanks were filled up after the previous attempt to cross the mountain pass so we did not need any fuel. Visual check confirmed full tank on both sides. Both fuel tanks were checked for moisture from drain point in the wheel well.

On run-up another check of the systems showed normal operation. Departed KMSO at 0845 LT. En-route all systems were normal. Approximately 25 to 30 minutes in cruise at between 1,500 to 1,800 AGL, I noticed a vibration. I looked at the engine instruments and did not see anything abnormal. Next I noticed that airspeed was rapidly decreasing along with loss of altitude. Full power was applied along with full RPM. The aircraft continued to descend at 70 kts (minimum clean). It was obvious that the aircraft was unable to maintain altitude. Another check of the instruments did not show anything abnormal.

With rapid loss of altitude I made the decision to conduct an emergency forced landing in a field.
