Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Nose of the aircraft including nose wheel and instrument panel was destroyed after touchdown due to unimproved grass/rock field.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On April 13th at approximately 0900 hours pacific time I obtained weather information from the national weather service and checked weather and notams at KTCM& KGRF the closest airports with weather reporting to S44. The airplane and route from S44 to S50 was my primary means of commuting to my place of employment at S50. I arrived at S44 at approximately 0920 and commenced preflight inspection on my airplane N5131H. I determined based on a visual inspection that the aircraft was airworthy and in safe condition for the planned flight to S50. I verified fuel quantity by visually checking the tank and verified it had 9 gallons of fuel. I verified oil quantity visually in both the gearbox and the engine oil injector. I got in the airplane and ran my restart checklist which included removing the pin on the ballistic parachute system. Engine started and ran normal. Once all temps and pressures were in the normal operating range i taxied to the hold short/run-up line of runway 16. I set rpm at 4000 rpm and checked the operation of both digital ignitions, check was normal. Performed an idle check, engine ran smoothly. Performed a flight control check by moving control stick and pedals in all directions to the control stops and visually verified correct control surface responses. All checks were normal. I made a departure call on the ctaf and after clearing final took the runway at approximately 0940. I did a final check of my instruments and applied full throttle and began my take off roll. Take off was normal in every respect. At approximately 200 feet agl after performing my climb check, I noticed that I was applying full right aileron as well as right rudder and unable to maintain level flight. Despite my control inputs the aircraft was continuing a left roll. In an attempt to stop the roll I applied forward elevator and reduced power to lessen left turning tendencies. Despite leveling the nose and reducing power, the aircraft was still rolling uncontrollably to the left. At this point the aircraft has turned nearly 180 degrees from runway heading and the airplane was displaced from runway alignment approximately a half mile. Still unable to level the wings, I decided to try deploying the ballistic parachute. I still had engine power and 80 MPH airspeed at the time of deployment with level pitch and am un-commanded left roll. I had hoped I could use the parachute as a wing of sorts and modulate with power to get back to the runway. Immediately after deploying the parachute, the aircrafts nose swung upwards that least 20 degrees nose up. The aircraft then swung back to approximately level pitch and left bank had been reduced to less than 5 degrees bank. At this point the aircraft is pointed at the departure end of runway 16 at a approximate heading of 250 degrees. At this point it became clear I would not make the runway. I focused on dodging a large tree and executing a forced landing in the field next to the runway. I attempted to flare before touchdown by applying aft elevator, the aircraft responded sluggishly and did not adopt a nose high attitude. It appeared to me that the nose barely came up above a level pitch. Immediately after touchdown on the mains, the nosewheel struck the ground and collapsed resulting in the nose of the aircraft crunching up as a result of my forward momentum. My legs were badly injured and I was unable to move. The parachute then drifted backwards and got tangled in the still running engine. I attempted to stop the engine but could not locate the key in the damaged instrument panel. It continued to run until the parachute cord finally fouled the propeller. Not long after touchdown, a bystander came running over asking if I was okay and telling me they had called 911. Not long after the emergency responders arrived on scene and began extracting me from the aircraft. Shortly after being extracted from the wreckage I was sedated on the way to the hospital.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This accident could have been prevented if the A&P who performed the annual condition inspection and adjusted the aileron control mixer had reattached and torqued the hardware properly. The investigators recovered the nylon hardware that had been improperly attached to the aileron push pull tube. The nylon threads indicated that the nut had not been torqued enough to cut threads into the nylon, indicating it was only finger tight. It took approximately 24 flight hours to come completely off and disable my ailerons shortly after take off.
