Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft damage is substantial from impact with a power pole, the ground, and a concrete wall. The other damage from this incident includes a downed power pole and associated lines, a field of brush burned, two cars damaged by fire from the field, and a concrete wall damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

The accident flight was to be round trip to/from U42, after an earlier flight that ended at 12:30pm. The FBO lineman topped off the tanks. After refueling, the pilot returned to the plane to conduct a preflight inspection. All four tanks were visually inspected to confirm fuel levels. Fuel sampling results were normal.

Both engine starts were normal, but the engines did not run as smoothly as usual at idle after start. When the left throttle was moved back to idle, the L engine cut out. The engine was successfully restarted. After startup both engines were running smoothly slightly above idle with all gauges in the green (CHT, Oil Pressure and Oil Temp). The left and right engine throttles were remained slightly above idle, where RPMs were smooth, and fuel was leaned for taxi to runup. During taxi, all engine gauges remained in the green with EGTs higher than usual (roughly 380 degrees).

During engine runup, when the left engine throttle was brought to idle the left engine died. Engine restart was successful and, thereafter, during runup all engine gauges for both engines remained in the green arc. Cycling of each propeller resulted in normal RPM drops. During the magneto checks, the engines ran rougher than expected with RPM drops of approximately 200RPM. Throttles were advanced and mixtures leaned to clear suspected carbon build up on the spark plugs. After completion of this procedure, the engines ran smoothly at idle. The magnetos were again checked, and RPM drops were within tolerances.

For takeoff, L/R engine fuel selectors were set to L/R mains respectively, flaps 0 degrees, mixture leaned for density altitude, props full forward, with auxiliary fuel pumps on low. On the runway, brakes were applied while throttles were advanced smoothly to approximately 2200 RPM, all engine gauges showed green, fuel flow appeared normal, and appropriate power was being generated by both engines. After brake release, power was smoothly advanced to full throttle. Acceleration was as expected.

After rotation, gear was retracted once the aircraft had a positive rate of climb and angle of attack for climb was established. The aircraft did not accelerate as usual during this phase of flight and no usable runway remained. Angle of attack was shallowed to aid acceleration. Power fluctuations, RPM changes and fuel flow fluctuations became noticeable on both engines. Gear and flaps were confirmed as retracted. Propellers and throttles were confirmed as full forward, auxiliary fuel pump placed on high. The aircraft continued its climb but was decelerating. The nose attitude was decreased to maintain redline. Returning to U42 for landing was not viable.

Redline airspeed was maintained while the aircraft continued ahead, and a descent was required to maintain redline as the aircraft was passing over a building. The aircraft had a slight yaw to the left side with an accompanied right bank in order to maintain straight flight. Identification, verification and feathering was conducted on the left engine, but the aircraft could not maintain level flight at redline with the left engine feathered and continued to descend.

Landing was imminent and, before touchdown, mixtures of both engines were pulled to cutoff. The aircraft hit a power pole with its left wing, impacted the ground and skidded to stop. The pilot felt his neck burning, sensed it was very hot in the airplane, pushed through and exited through the windshield of the airplane, cleared the area, and received medical attention.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The cause of the accident is unknown at this time. The operator recommends shoulder restraint installation and use.
