

X

Q ↺ 1 ||| ∨

A strong southwest flow aloft will bring the potential for mountain waves across much of east central and southern ZLC thru Sunday night with the best conditions across eastern UT and western WY and on into CO. Pilots...as always should get a thorough weather briefing before any planned flights. Additional weather info available at aviationweather.gov.

Southwesterly to westerly winds aloft, along with areas of gusty winds at the surface and at ridgetop levels, will continue to produce mountain waves and increased turbulence. Monitor weather.gov/zlc and aviationweather.gov for updates.
