Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The A/C impacted nose high with about a 15 deg. right AOB. The right main landing gear was bent back, both leading edges and tail had impact damage from vines and supporting fixtures for them. The aircraft flipped over (tail over nose) and the windmilling prop bent when it impacted the ground. The engine mount was broken and the crankshaft was bent. The firewall and turtle deck were also damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 30 October 2017 at about 1345, after a normal start and run-up, my Vans Rv-6 N88MV took off from Chandler Executive Airport (KFCH) for a local flight. I proceeded west to climb above the Fresno Yosemite International airport and then overhead the field to get a transponder check with Fresno Approach and then headed towards the west/southwest. About 15-20 minutes later, with cruise power set, I started my descent to get below the (KFAT) Class C airspace and return to KFCH. At about 4,000 ft I noticed that the batteries were getting hot based on their proximity to my right foot. I selected the engine monitor display and saw that they were indicating 15.5 volts and the alternator was still charging at +30 amps, at this point the engine suddenly lost power. I selected the nearest field and began a gliding descent towards Selma (0Q4) which was about 10 miles to the east. I told Fresno Approach about my plan and gave them the required information. At about 1,000 feet I determined that I was not going to be able to make it to Selma and selected an off airport landing site that was Ceder Ave. At the time there was only one truck on it and I determined that it was wide enough to land on. As I continued to descend, I was unsure of my ability to pass over the on coming truck so I offset to the west side of the road in case I couldn't avoid the truck. The truck passed as I was about 50 ft AGL and I was able to make a left turn and go under the power lines in an attempt to get back to the road and avoid landing in the orchard that was below me. I was unsuccessful in getting proper alignment with the road and ended up crossing over it where I impacted terrain on the east side of the road in a vinyard. The aircraft came to rest completely intact, upside down after the nose dug into the dirt and flipped over. I was able to break the canopy open and evacuate the aircraft with no injuries.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

A circuit breaker for the alternator was installed but it was not triggered. Make sure that some kind of failsafe is installed and operable, especially if an electronic ignition or other electronic engine system is installed.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

I believe there was an alternator/internal voltage regulator failure. The manufacturer and model is unknown though. The voltage output of the alternator was checked the week before and it was producing 13.75 volts to the essential bus, correct for a regulated alternator.

EVACUATION OF AIRCRAFTWas an emergency evacuation of the aircraft performed? ☒ Yes ☐ No**Method of Exit** – Describe how the occupants exited and how many occupants evacuated each location

The sliding canopy was pinned closed by the weight of the aircraft on top of it. I was able to break the side of the canopy with a screwdriver that I keep inside the aircraft.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

An electronic fuel injection and ignition system was recently installed with all recommended safeguards installed. I believe the over voltage/high output of the alternator caused an internal failure of the computer that controlled the fuel injection and ignition. I am in the process of working with the manufacturer to determine the cause of the failure.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
