NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

In September I noticed the engine seemed a bit rough on the right mags in cruise.

During the annual inspection on 9/21/2018 all spark plugs were replaced and the wire ends cleaned. No roughness was noted on the next flight from 68CA to KPAO.

Early morning of 10/15/2018 I was unable to start the engine at O79. The overnight temp was 30F. While pumping the throttle the cable broke at the knob end. It was repaired by Nervino Air Service on 10/17/2018.

Early morning of 10/22/2018 it took 1 1/2hrs to start the engine when departing KDWA. I flew from KDWA to 68CA to meet my A&P (Eric Sawyer) to install door stuarts and a wolf oil filter. On the flight the fuel flow indicator showed 26gph. Normal cruise is 12gph. When I landed Eric noticed fuel dripping from the cowl. He found that the fuel line from the fuel flow meter to the fuel filter was not tight.

Because I had been having so much trouble starting the engine in the cold he removed and checked the wires and plugs. Lead deposits were found in the lower plugs and cleaned out. We mounted the remote oil filter but ran out of time to finish.

The afternoon of 10/22/2018 I flew from 68CA to C83 and added approximately 40g of fuel to fill the tanks. I flew from C83 to KPAO, approximately 20 minutes. The FS450 fuel flow meter indicated 60g remaining.

The morning of 10/30/2018 I departed KPAO at approximately 8:00am for 68CA. I did not have any trouble starting the engine. I flew at 3500' with a 30-35mph headwind. Approximately 4 miles from 68CA at 2500' I intercepted the runway heading for runway 32 and made a radio call. I put in 20 degrees of flaps and slowed to 65mph. Over the the sacramento river approximately 1.5mi from the 32 threshold at 1500' the throttle was at approximately 17" of manifold pressure. When I added power to maintain altitude on the approach, nothing happend. I cycled the mixture and the mags. Nothing changed. I was now below glideslope for the runway because it sits on 600' bluff. I could see a field in front of the bluff ahead and on the right. There was a set of low power lines between the plane and the field. I didn't feel confident trying to go under the power lines so I maintained glide. I glanced at the airspeed indicator and saw 40mph. I did not hear the stall warning. The next thing I know the plane was sliding on the ground. I turned off the master power and mags. The passenger seat was dislodged and the passenger door was missing so I climbed out that side.

The wreckage was all intact.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Maintaining airspeed immediately after noting loss of power.
