Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The nose and both main landing gears were torn from the airframe while extended and upon impact with the ground. The three blade propeller also struck the ground upon impact. One blade was curled at the tip, the second blade was slightly curled with evidence of damage and the third blade showed no damage at all. The leading edge of the left wing was severely damaged when striking a runway exit sign, and there is visible indication that the spar was likely bent slightly aft from the mid-wing point outward and also there was visible damage to the top skin and aileron. There was visible damage to the lower front cowl area but because the aircraft came to rest on its belly without landing gears, I would assume there was also substantial damage to the remainder of the bottom fuselage and bottom of both wings. The airport's runway exit sign was broken loose from its mounting on the ground when being struck by the left wing and the extent of damage is not known to me.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On May 1st, the day of the accident, I met with Mr. Schaefer, owner of the aircraft, at about about 7:40 A.M. at the hangar where the aircraft was located. For about one hour we then discussed a number of issues pertinent to this make and model Beechcraft Bonanza along with actions to be taken in the event of unusual or unplanned circumstances, such as what to do should the cabin door suddenly pop open after liftoff, etc.

After pulling the airplane out of the hangar we spent about another thirty minutes in the cockpit before starting the engine, reviewing the location of all switches, circuit breakers, instruments, controls and other issues such as proper closing of the cabin door, stowing the emergency gear extension handle, the fuel selector (it's handle indications, indent, etc.) and answering other questions that came to mind.

The pre-engine start check list was reviewed and after engine start we taxied to the run-up area short of Runway 21 where we then spent another 15 - 20 minutes carefully adhering to all items called for on the pre-take off check list before referring to the take-off check-list. Prior to this flight and on occasions previously, I told Mr. Schaefer that the primary purpose of our first instructional and future flights together in this airplane was to allow him adequate time to become familiar with the handling and flight characteristics and to reach a satisfactorily level of comfort, confidence and proficiency as pilot in command.

After the airplane was positioned on the Runway 21 center line, Mr. Schaefer slowly advanced the throttle initially but after moving a short distance in alignment full throttle was used and acceleration appeared normal as I monitored the engine instruments and airspeed indicator activation. When Mr. Schaefer called out "80" (meaning indicated airspeed) I slightly gripped the dual control column to assure that he was applying proper input to rotate and it was at that same moment that the engine sounded as if the throttle was suddenly retarded from its full forward take-off power position, to that of idle. The stall warning horn instantly sounded steadily and instinctively both Mr. Schaefer and I pushed forward on the control column to reduce the apparent critical angle of attack due to the pitch angle of rotation and sudden loss of thrust from the propeller. Although the wheels had barely left the runway at that point, the takeoff acceleration/momentum and initial pitch attitude caused the aircraft to climb another ten feet or so (estimate) before our control input changed the pitch attitude downward. The right wing also immediately lowered as I suspect it was starting to stall first and possibly because its fuel tank was full whereas the left tank had about 60 pounds less fuel and there was a slight left crosswind. I saw with peripheral vision that we were drifting off the runway to the right and passing over the bare ground between the runway and parallel taxi way.

Impact occurred immediately and there was no time to apply any further control input or to take other evasive action. I don't know if the landing gears were torn off during this initial contact with the ground or if they were knocked off a few moments later when the aircraft slid into and over a rock covered 3 - 5 foot embankment before sliding to a stop.

Neither Mr. Schaefer or I sustained any apparent injuries during the crash and airport FBO personnel arrived at the scene shortly thereafter. Sedona police and fire department personnel also arrived within ten minutes after the incident occurred.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I am not aware whether or not Teledyne/Contential or the engine-driven fuel pump manufacture has ever issued a Service Bulletin or if the FAA has issued an Airworthiness Directive calling for a periodic inspection, overhaul or replacement of this component. Since I have spoken to two other persons since this incident, who have experienced a engine-driven fuel pump failure on their V-Tail Beechcraft Bonanza airplanes (one such incident causing an off-airport crash landing resulting in the airplane being declared as "totaled" by the insurance company) I would suspect that this sort of cause for an engine failure is not all that uncommon and that more awareness of the potential possibility should be made available to owner/operators of aircraft equipped with this accessory.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

It is my opinion that the engine-driven fuel pump experienced a mechanical malfunction at the moment of rotation from the runway. The simultaneous pitch up attitude and sudden loss of propeller thrust caused the stall warning horn to sound instantly and continuously. Because the engine sounded as if the throttle had been suddenly pulled aft from a full-forward take-off power position to that of a full aft idle position, it is my belief that that the cause was fuel starvation. There was no sound that indicated the engine was detonating or that one or more cylinders was not getting electrical spark to the spark plugs as may be the case if a magneto had failed.

Exit was through the single cabin door on the right side of the fuselage. Both I and the owner/pilot departed the aircraft through that door after the airplane came to a complete stop.

Use this space if additional space is needed for any answers.

On Page 6 of this report where "Flight Crewmember 2" Information is asked there is not a space where Total Bonanza Time can be shown Therefore I wish to report that my total time in all makes and models of the Beechcraft Bonanza is 845.4 hours.
