Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Minimum speed landing in very soft field resulted in nose wheel arrest as it burried in dirt and subsequent end overturn of aircraft. Damage to engine cowl, propeller, nosegear, motor mount, firewall, and top of rudder.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the afternoon of June 6, 2019, my son and I planned to fly a Cessna 150 (N6617F) on a training flight around the Sacramento area. My son performed a cross country plan, putting together weather, NOTAMs, navigation and performance information before preflighting the plane. On preflight my son noticed significant water when draining the wing tank sumps and gascolator. He continued to drain the sumps until no water or debris was noticed. 8 gallons were noted in each wing. We taxied to the fuel farm at Yolo SkyDance where we filled both tanks. My son again drained fuel from the sumps and again noticed significant water. 5 repeated drainings were required before water free samples were obtained. Having noticed water again, we discussed the possibility of stirring/freeing up trapped water and decided to rock the wings and test again for water. After rocking the wings, waiting and draining the wing sumps, no water was noticed, and we continued with our departure.

We took off KDWA Runway 16 and via a downwind departure from the traffic pattern headed for Watts Woodland Airport (KO41). We performed a single touch-and-go landing at KO41 and at all subsequent airports on our flight – Woodland (O41) to Colusa (O08) to Yuba Co (KMYV) to Lincoln (KLHM) to McClellan (KMCC) to Mather (KMHR) to Sacramento Executive (KSAC) to the crash site.

Our next stop was to be KEDU. At 1500ft over farmland south of Davis CA, I pulled power and had my son perform a practice engine out. He correctly added carb heat, pitched for best glide, turned towards an emergency landing site, and performed or called out engine restart procedures. At an altitude of 500ft, I called out recovery and my son applied full throttle. The engine came up to full RPM for about 40 seconds before stumbling falling back close to 1000 rpm. I immediately took over control and attempted engine restart while pitching down to maintain bestglide. The engine did regain power briefly for perhaps 10 seconds, but then stumbled and stopped entirely. We continued to attempt restart while preparing for an emergency landing. We turned into the wind and landed in a full stall. While we had remarkably low forward speed, the plane decelerated immediately upon landing, and slowly turned end over coming to rest upside down.

We immediately exited the airplane and soon after contacted FAA and NTSB.
