Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left landing gear strut broke
Crumple zone between bottom of seats and aircraft belly compromised.
Fuselage where wings connect wringled/bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Solo Cross Country from U42, to KOGD, then KLGU where the incident happened. The flight was uneventful until flying over Sardine Canyon towards KLGU at 9000ft. Experienced turbulence and heavy downdrafts that caused center console to open and scatter its contents in the cabin. I cleaned and secured what I could safely in flight and decided to do a full stop at KLGU to clean up any secure any remaining center console contents. I cleaned the cabin, re-inspected the aircraft, and went back through the start up process. During the run up procedure, while doing the magneto check, the engine died (propeller fully stopped) and then recovered. I taxied back, parked, and shut down the aircraft. I called my CFI, explained the situation, and was given the advice to try the run up again at a slightly higher RPM for a minute before re-trying the magneto check (assuming to diagnose/cure if it was a fouled spark plug). I started the plane, and the fuel pump sounded much louder than usual. Called my CFI again to ask about the loud fuel pump. Was advised to try the run up to see if that would solve it and to use slow smooth throttle movements as well. Started the plane again, and fuel pump was still loud. The fuel pressure was fluctuating in the normal zone, but dropped suddenly to 1.8 PSI when I turned on the avionics. It soon recovered to 3.5 PSI while still fluctuating within the green range. I attempted another run up following the instructions from earlier and was successful. Everything appeared to have stabilized and the fuel pump was sounding better. At approximately 1110 MTN, I taxied to runway 28 at KLGU for take off. Used the slow smooth throttle inputs during take off and everything appeared to be working, got airborne, and when I was around 50-100 feet in the air the engine started running very roughly and sputtering, I looked at the engine gauges and noticed the fuel pressure had dropped to 1.0 PSI. At that moment I looked up, saw enough runway to attempt to land. I pitched down and pulled the throttle back to recreate a normal landing situation. When I attempted to flare, instead of the aircraft floating the normal amount, landed pretty hard. Was able to stop the aircraft by the end of the run way. Noticed left landing gear was bent, but the wing had plenty of clearance so I taxied back to the tie up area and shut the aircraft down. Inspected the aircraft and saw a crack in the left strut. After Dustin arrived and inspected the aircraft, it was clear the aircraft would have to remain over night. While we were preparing the aircraft to stay overnight and pulling the aircraft to an overnight tie down spot, the left strut continued to degrade, but held. Left the aircraft tied down for the night and left at approximately 1415 MTN.

Post flight thoughts on why the landing was hard is that it was likely a combination of two factors. One, I had no flaps in and tried to land and flare like a normal landing with full flaps, and two, I was likely slow from the takeoff and the engine giving out and not having enough altitude to trade for enough speed for the flare to be more effective.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Unknown - Student pilot reported engine running rough, with low fuel pressure indicating on EMU. After inspection of fuel system, fuel was in fuel lines and in carburetor. Fuel tanks, lines, filters clean with no debris observed. Electric fuel pump moved fuel thru fuel lines. Fuel in gascolator.
