Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The nose wheel separated from the aircraft, and the nose wheel structure and fuselage in the vicinity of the nose wheel suffered damage. The top of the fuselage was bent, and the windshield was broken. The left wing tip suffered some damage when it struck the ground, and partially separated from the fuselage (2-3 inches). The propeller struck the ground, and was bent. The top of the tail suffered some damage. The door was broken by first responders in order to extricate the occupants. Other property damage was one broken wood fence post, and four barbed wire strands were broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

We were taking off from the Harlowton airport (KHWQ) on Runway 27, heading west. There was a headwind blowing straight down the runway at approximately 9-14 knots per hour. Because we were about maximum weight, I treated the takeoff as being a short field takeoff. For short field take offs, the handbook calls for rotating at 55-60 MPH, using two notches of flaps, which I was using. The last time I looked at the airspeed indicator before rotation, the aircraft was doing 77 MPH. I rotated and we began to climb before reaching the end of the runway. Shortly thereafter, the aircraft began to lose airspeed and lift. I lowered the nose in order to maintain airspeed. Ultimately, the aircraft could not maintain enough lift, and landed in a pasture approximately three-quarters to one mile west of the airport.

Two days prior to the crash, I had the airplane in to the FBO, as I felt it was not generating as much power as it had been in the past. The FBO asked what RPM was getting on take off, before rotation. I informed him I was getting about 2,300 RPM. He stated if I was getting between 2,200-2,300 RPM, and assuming the tac was accurate, then the aircraft was generating full power. He tested the tac, and found it to be accurate. So, he said the engine was fine. He was telling me what I wanted to hear, so I accepted it. Although in hindsight, I should have been more skeptical and I do think the engine power was a factor.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I do think at least three factors combined to produce the accident. The airplane weight, weather conditions (wind and temperature), and power produced by the engine all combined to produce the unfortunate result.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

I do not believe there was a malfunction of one particular part. However, in hindsight, I do believe the engine was not providing as much power as it should have.
