Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft collided with a hanger. The propeller impacted and is scratched and bent the spinner is crushed. The left main gear and nose gear are bent. The left side glass is broken. Both wings have substantial damage. The left main wing wingtip is severely damaged and the wings leading edge has multiple dents and deformations. The right main wing has similar damage to the left wing and it's spar is bent toward the rear. The band starts at about 50% the length of the wing. The engine is presumed to be severely damaged as well from the propeller impact.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

The flight departed from OG20 at approximately 9:20 AM local time and landed at 4S9. Weather had been previously obtained via ForeFlight. Fuel was purchased at Mulino Airport. The flight departing Mulino Airport at approximately 10 AM local time to the practice area. After practicing maneuvers the flight came back to OG20 approximately 11:30 AM local time. A normal traffic pattern was flown. The airplane was a little fast on final, not sure exactly how much. This contributed to the landing being a little bit long. Touchdown occurred approximately 900' from the end of runway 16. There was a small bounce then the airplane floated for a while and touchdown again. After some normal braking procedures were attempted, including increasing backpressure on the yoke and actuating toe breaks, the pilot started to lose control of the airplane. It veered to the right and continued to slow down. Unfortunately there was enough energy left that it connected/crashed into one of the hangars. The right wing connected first causing the aircraft to rotate clockwise. The left wing and cowling connected next. This brought the airplane to a complete stop. The airplane did not lose any of its parts they were just mangled with the exception of pieces of the left window. The hangar door splintered and broke into large chunks which did not affect the structural integrity of the building. The runway is turf with grass and that contributed to the loss of control being sustained and braking to be less effective.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

First go around could have been used when once air speed was determined to be too high

Second, go around could have been used once it was determined that the touchdown point would be long.

Third, the pilot could have been a little more patient on brake pressure.

Forth, as soon as the aircraft begin to veer brake pressure could have been released.
