Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft Damage - Main Gear Strut Bracket Assembly (separated into 3 pieces), Main Gear Strut Bracket Assembly Channel under the Aircraft (part of the landing gear carry through pierced the channel into the cockpit under the passenger seat), Tail Skid / Bottom of Tail (bottom portion separated and fell off), Underside of Horizontal Stabilizer (damaged from sliding on runway), Bottom of Elevator (damaged from sliding on runway), and Tail above and forward of attachment for the Elevator (from the elevator stopping the airplane from rolling on the ground).

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 04 Nov 2020, I was conducting flight training with Chris Daily in N87GX towards his Sport Pilot License.

Glendale Municipal Airport KGEU.

ATIS information A at time of taxi for initial take off was Wind Calm, Temperature 27, Due Point 2, Altimeter 30.12, Runway 1 in use.

Chris conducted a preflight of the Aircraft Prior to my arrival at the airport and I conducted my own preflight of the aircraft prior to operating the aircraft.

We taxied out for pattern work at about 1130. We briefed that all landings were going to be to a full stop following the ACS / PTS guidelines for Sport Pilot.

The first take off was a normal take off on Runway 01. The first landing was a normal landing which Chris did nearly perfectly. Soft touch down on the center line. After the first landing we taxied clear of the runway and taxied back to runway 01 for another take off and landing.

The second take off on Runway 01 was a simulated soft field take off. On short approach to landing at about 20 feet above ground level I told Chris to go around. Chris performed a go around and we entered the pattern.

The Second landing was a simulated soft field landing. Chris was controlling the aircraft. A small amount of power was being carried along with full flaps to facilitate the simulated soft field landing. On touchdown the airplane slightly yawed to the left and we started drifting about 3 feet left of the centerline. Once the wheels were on the ground Chris slowly reduced power and maintained aft elevator to facilitate the simulated soft field landing. I was following Chris on the controls in case I needed to take over control. Chris was applying corrective rudder to bring the aircraft back to the centerline. The airplane started to roll to the left and I took control of the airplane and applied full right aileron and applied heavy right rudder to stop the yaw and roll to the left. The right wing started to come down and that is when I noticed that the right gear leg was collapsing. We could hear a scraping sound which startled Chris causing him to apply full power to go around. I stopped Chris and pulled the power back to idle to prevent taking off. The aircraft started yawing and drifting left. I was afraid we might slide off of the runway so I applied power to increase rudder authority to keep the airplane on the runway. We exited the runway onto the high speed taxi way A-4. Once clear of the runway I shut off the engine and we exited the aircraft.

No physical injuries occurred.

Airport Operations retrieved a piece of the landing gear carry through from the runway where it became detached from the aircraft on the runway.

I believe the initial left yaw that occurred on landing was from the left main gear starting to collapse. The left rolling we experienced was the left gear collapsing. The aircraft returned to somewhat level when the right gear collapsed after applying the right aileron. The Elevator was resting on the ground which prevented the aircraft from touching a wing tip to the ground.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Currently The Remos GX has a Service Bulletin that addresses structural cracks that may form in the original Main Gear Strut Bracket Assembly. The Service Bulletin calls for inspection and allows 800 landings to be done on the old style gear before replacement with a new style carry through which is more durable and not prone to the same structural cracking.

The Main Gear Strut Bracket Assembly failed and collapsed on a soft touchdown at 437 landings which is well within the 800 allowed landings according to the service bulletin.

I believe that to prevent similar gear failures in the future it would be best to mandate replacement of the main gear carry through with the newer and heavier built version that is available.

The outcome of this accident could have been far worse if the part failed during a hard landing, cross wind or high winds, or by a solo student with limited experience.
