Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wingtip and aileron damage. Tailwheel springs departed the aircraft.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On Tuesday 3, 2020 we waited for morning fog to burn off to fly. By late morning the fog had burned off completely. The student with whom I was flying is an accomplished tail wheel pilot. He came to me for a tail wheel endorsement and has continued to fly with me on a weekly basis for over two years. I am a flight instructor with over 830 hours time in various tail wheel airplanes. Our morning in the pattern was uneventful, three take offs and landings to full stop, three point landings, taxi back to take off.

Our final landing was a from a normal approach and used normal flaps. The airplane touched down and began tracking down the runway with no indication that anything was abnormal. Then the airplane started pulling off to the left. We were headed toward the infield between the runway and the taxiway. I called out, "my airplane" and took over control of the airplane. I confirmed that the yoke was full aft and started applying right rudder. There was no response. More rudder, still nothing. To give an entirely accurate account of what follows in the next few seconds would be impossible. Everything was developing quickly and the airplane was not responding to inputs. I remember finally trying tapping on the brakes. The airplane then started recovering to the right. Now left rudder inputs were ineffective. The airplane continued turning to the right. It developed into a ground loop. The left wing dragged on the ground. We rotated through about 200 degrees and came to a stop on the runway. When I powered up to try and get the airplane off the runway it was clear that we have no tail wheel authority.

After the incident, upon runway inspection with ground operations personnel, we recovered the springs that connect the rudder cables to the tail wheel. One spring was recovered on the runway after the numbers and before our incident, the other off the runway past our ground loop. This would suggest that one spring was responsible for the loss of directional control and that the other was lost during the ground loop.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Tailwheel springs departed the aircraft; assumed to be a failure of the connecting chain. Part number and time in service unknown.
