Date Report Received

We flew in Moab, UT (Canyonlands Field KCMY) for holidays on Jan 31st and parked the plane on the ramp. On Jan 2nd, we found plane with some structural ice layer and therefore brought the plane in heated hanger for two and half to three hours and attempted to start after control surfaces appeared thawed and clear. However, couldn't start due to cold engine and battery got discharged and ran out. Attempted starting with GPU but unsuccessful. Placed the plane in hanger for additional 2-3 hours and reattempted starting and engine came alive with single stroke. I had filed direct IFR flight plan to KSLN for approximately 2:30 pm departure time. Canyonland fields rests on 4590 ground elevation with surrounding mountains and restricted area to the west.

After oil pressure and temperature were assured, plane was taxied on taxiway A to runway 03. Runup was done and appropriate rise in EGTs were observed in EDM930 (Engine monitoring system). All engine indicators were in green and in range. Quadrant were set to mixture rich, prop full forward and throttle advanced to achieve 31-32 to manifold pressure. Normal take off role and air speed came alive and rotated at 65-70 in VFR weather. Airplane got airborne and was about 100-200 feet? above the ground when I experienced engine roughness and lose of power. Given that I decided to retract the landing gear, to reduce drag, which normally provide 25 knots. However, meanwhile in the midst of that, I felt more loss of power, altitude, maneuverability of plane and potential to stall. Additionally, given the geographic location of nearby mountains and restricted area to the west, I decided to land on runway ahead of me. I re-extended the gear and braced for landing. Plane landed to the left of runway without known impact experienced by all four occupants. Following touchdown, it slipped over the snow and with left gear extended, which I could see. After some distance, while attempting to break, plane slid over from left side to the right of runway and went into half circle spin and stopped. Unsure at what point right landing gear collapsed or never fully extended....?

All four of us came out without a scratch through main and emergency door. There was no visible fuel/oil leak, smoke or fire. We stayed away from plane until emergency vehicles came ashore..... There was no visible structural damage to the runway or surroundings. I recognized collapsed right landing gear, and damage to the right wingtip and horizontal stabilizer from distance and close.

After we came inside the airport, my son mentioned, he noted 42 gallons fuel flow to the engine, which is certainly higher than recommended 37 gallons. This is a TN550 Continental engine with engine driven fuel pump.....
