Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

2/3 Tail boom separated, MR blades contacted ground and tailboom, Main cabin plexiglass broken, but cabin was mostly intact. Aircraft landed in an agricultural field, no crops currently, no damage to any structures in the vicinity

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Wednesday January 13th 2021 at approximately 1300 at the Spanish Fork airport (KSPK), after a normal preflight, We (Troy Mason and myself(Patrick Omer)) started Helicopter N7480F in preparation for a training flight for private add on rating. We entered the traffic pattern using the taxiway parallel to Runway 30 making left hand traffic. We performed a normal, and a steeper than normal approach, and several quickstops. We then entered the traffic pattern for the runway(30 was in use) and performed 3 straight in Autorotations each separated by a traffic pattern. We departed the traffic pattern to the west climbing to 6500' to demonstrate settling with power and its recovery. We did this twice. After the last one we were headed back toward the airport at 6500' (1500' AGL), I announced a simulated engine failure. Troy responded appropriately by lowering the collective and entering an autorotation. After establishing ourselves in the autorotation I asked Troy where he planned to land as if this was a real emergency. He pointed one out and flew toward it. At this point (500' AGL) I asked him to recover, meaning roll in throttle and add collective to establish a climb. That's when we noticed that the engine had quit and I took control of the aircraft. Troy attempted an in air restart while I flew the aircraft. At about 30' agl I performed a flare to reduce airspeed and rate of descent. As we neared the ground I raised collective to cushion the landing and reduce our descent rate further. At ground contact we had about 5-8 mph of ground movement. The ground had just recently been plowed and was soft and rough. This coupled with our forward momentum caused the aircraft to nose heavily forward on impact causing the MR blades to contact the tailboom and severing it from the aircraft. The front right skid tube also broke and the helicopter rolled onto it's right side and came to rest. The cabin plexiglass broke, but the main cabin structure remained relatively intact and we were able to extricate ourselves through the front window. I turned off the battery before climbing out of the aircraft.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The engine quit when the throttle was reduced during a practice autorotation. Un-sure if there was a mechanical reason for this
