Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft sustained damage to the right propeller, the right wing flap and the trailing edge of the right wing forward of the flap.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

The flight ramped out at 1317 local time. The aircraft preflight noted no hydraulic leaks and the main struts had proper inflation with four fingers worth of spacing. There was no visual damage to any part of the landing gear system or brake system.

The aircraft was cleared for a north departure. The pilots performed a practice aborted takeoff followed by a short field takeoff. They executed a north departure on a path vectored to approach for RNAV 34 at S33. They did the approach simulated single engine landing straight in on runway 34 with a smooth normal landing touch and go followed by two more normal touch and go landings at the same airport.

The flight then departed south practicing maneuvers while en route to KRDM. They approached the airport by way of the gap between Grey Butte and Grizzly Mountain and contacting Redmond tower over O'Neil approximately 8NM north of the airfield at 4100' MSL.

N125MG was cleared into the delta airspace to enter a right downwind for runway 29. They did as instructed and were prepared to extend downwind for final traffic on RNAV 29. When they were cleared to land they turned base and executed the GUMPS check. They turned final at 500' AGL and established a stable descent at 600 FPM and between 80-85 kts AIS. The student applied 40 degrees of flaps and re-trimmed the aircraft to maintain the stabilized approach. The stabilized approach was maintained all the way to touchdown on the 1000' markers. N125MG smoothly decelerated with the plan to exit left on taxiway F approximately 2000' down the runway. As they slowed to taxi speed the PIC felt the aircraft starting to pull to the right. He assumed it was a flat tire and worked to maintain centerline but the wing continued to sink. The PIC was unable to maintain directional control as the airplane came to a stop.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Compliance with Piper Service Letter 1263 issued in December of 2020 could have prevented this event.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Strut Assy--P/N: 67037-004

Tube--P/N: 95701-002 (The IPC is not super clear on which component this is on the landing gear but I believe it is the actual part that failed)

Manufactured by Piper

Strut tube cracked and completely sheared from the airplane
