Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

1. Head: Nose cone is deflated and tips for both sides of propeller are bended back. And one front side of propeller is scratched.
2. Left wing: Mid top is deflated and wingtip is bended a little bit. The right front side is deflated in. And wingtip is scratched.
3. Right wing: Mid top is deflated a little bit. The front side of the wingtip is scratched.
4. Tail: Top of the tail is broken and bended to the right. Vertical stablizer is bended to left a little bit. The inside of left horizontal stablizer is bended to top.
5. Back window: Both windows are broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

1. After passing Skagit airport, I checked ATIS information for Bellingham airport and completed the pre-descend-landing checklist. The weather information was Juliet, wind 290 at 8 knots, SKC, altimeter 3012 and runway 34. After that, I called Whidbey approach to cancel flight following to Bellingham.
2. After cancelling the flight following, I started to descend from around 4500 to 2000 ft before reaching my next checkpoint, Chuckanut bay.
3. Over Chuckanut bay, I called the tower for landing clearance. " Bellingham tower, Cessna 51380, Over Chuckanut bay request full stop landing with information Juliet. " . The tower responded as " Cessna 51380, report 3 mile on final runway 34 " .
4. After getting the response from tower, I slightly turned left in order to align myself for final of runway 34. And I also started to descend from 2000ft to get to pattern altitude(1200ft).
5. When GPS showed that I was 3.5 miles away from Bellingham airport, I called tower to report 3 miles final for runway 34. After getting clearance to land from tower, I reduced the power to 1500rpm and the airspeed started to decrease to below 85knots. After airspeed was below 85knots, I added 10 degrees of flaps. Then I lowered down the nose in order to keep airspeed as 75 knots. After the airspeed reached around 75 knots, I trimmed the airplane.
6. After the airplane flew for around 10s, I added the another notch of flap and adjusted the airspeed to 70knots and kept flying a few seconds. Then I added 30 degrees of flaps for landing and kept the airspeed around 65knots.
7. In order to take care of the cross wind, I stepped on right rudder to align the plane ' s nose to runway 34. After alignment, I used left aileron to counter the cross wind (270 at 9 knots). Initially, I used too much left aileron and the plane drifted to left too much, so I released the aileron to get back to right.
8. During the final, my aiming point was the numbers for 34. The airspeed was kept within 60 to 65 knots before I rounded out.
9. While approaching on final, I realized that I lost too much altitude, so I added some power in order to keep the altitude. When I was sure I can reach number 34, I reduced the power back to maintain my glide to the number.
10. When I was flying over threshold of the runway, I cut the power to idle and pitched up the nose to round out and flare. Here I made a small mistake, pushing the throttle in right after powering to idle because I tried to put my hand on the back of throttle. I powered it off again right after the mistake.
11. Initially, I flared too much so the airplane ballooned up a little bit. I released the pitch pressure to let nose drop down, so that the plane stop climbing. Then I applied back pressure again to keep flaring. During flaring, the airplane is blown off the center to the left from too much left aileron, I corrected it with right aileron.
12. Then the airplane touched down on the ground without a hard drop. However, the plane is off the center of runway 34 to the left then the airplane went right and left alternatively. In order to centralize and stabilized the plane, I stepped on both brakes slowly to slow down the plane. However, the plane nose suddenly went to the right and the nose went down and tail tried to lift up. Even though I tried to pitch up, the nose kept falling down and the plane flipped over. From touch-down to flip-over, the plane moved forward for around 5 meters.
13. After flipping over, I called tower for help

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. After the plane balloons and I release the yoke pressure, I should add a little power to reduce the descending rate.
2. After the landing, I should not touch the brake too soon.
3. I should turn back to Paine field airport or go around when the cross wind is very close to regal air limitation.
