

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Coeur d'Alene State: ID

ZIP: 83803 Country: USA

Latitude: 47-46-27.5000N Longitude: 116-49-10.5000W

(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 05/11/2021 Local Time: 11:15

mm/dd/yyyy

Time Zone: PDT

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: N7296K

Manufacturer: Piper

Model: PA18-105

Serial Number: 18-210

Year of Manufacture: 1950

Amateur-Built: ☐ Yes ☒ No If Yes: ☐ Kit/Plans ☐ Original Design Make: _____

☐ IFR-Equipped and Certified

☐ Commercial Space Flight

☐ Unmanned Aircraft

Maximum Gross Weight: 1750 lbs

Weight at Time of Accident/Incident: 1500 lbs

Number of Seats: 2 Flight Crew Seats: _____

Cabin Crew Seats: _____ Passenger Seats: _____

Number of Engines: 1

Category of Aircraft

- ☒ Airplane
- ☐ Balloon
- ☐ Blimp/Dirigible
- ☐ Glider
- ☐ Gyroplane
- ☐ Helicopter
- ☐ Powered Lift
- ☐ Rocket
- ☐ Ultralight
- ☐ Unknown

Type of Airworthiness Certificate

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left main gear failure. Left wing spar damage. Prop strike.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Augustus Macy and I departed ID05 at approximately 9:30, remaining in the pattern there to complete 4 normal, 3 pt landings then proceeded to KCOE for practice landings on pavement and wheel landings. Gus was doing well, I was still assisting, but Gus was light on both stick and rudder controls. Gus showed no tendency to over control an aircraft. I never had to wrestle controls away from him. My occasional inputs were easy. I do like to take care of my airplane, so I stay ready to respond. It was our 6th Stop & Go at KCOE. We started with two low passes to teach centerline alignment. He was very good at aligning the longitudinal axis with the centerline. We naturally utilized two slight bounces to teach recovery via transitioning to 3 pt. The 6th landing everything seemed to sync perfectly in Gus's mind and he rolled the wheels on with the tailwheel low, just an inch or two off the pavement. Almost immediately the tailwheel eased onto the pavement as the stick came straight back and it was time to ease on brakes for the stop. At this moment the airplane veered left. It's not uncommon for a pilot to be "wiggly" right after touchdown. There was no unusual movement of rudder pedals or stick. I stepped in applying right rudder continuing to some right brake. The left wheel remained feeling in a braked condition. I continued to full right brake. My brakes are not powerful. I still have/had the standard weak Cub brakes, and the 3" extended gear, to reduce chance of over braking and flipping over. We departed the runway, momentum continuing left at 20-30 mph, and full right braking unable to stop the left turn that felt to be caused by a left brake still on. It appeared to me the momentum was going to cause us to cartwheel and end up upside down with a trajectory towards hangers and a truck parked on the ramp. I believe that result would have included injuries to occupants, which of course was my primary instinct to avoid. I needed something else to regain directional control so I added some power to get air flow over the Cub's large control surfaces, doing all I knew to try to come to a stop right side up and slow, without hitting any obstacles.

On walking back over the runway excursion path, after getting out, the Cub's wheels seem to confirm my visual, kinesthetic and auditory recall of the event that totaled just a couple seconds. On the grass between Rwy 20 and taxiway Alpha, just north of taxiway Bravo, main tire tracks appeared to be skidding, both brakes on, as the tailwheel that initially tracked out to the right (airplane nose swinging left) came back into alignment between the two mains (maybe) 6-10 feet prior to hitting the berm onto Taxiway Alpha at about a 50° angle (heading about 150 - 160°?). The berm felt to bounce us briefly into the air. I did hear a loud bang on hitting the berm, the gear may have failed then, or at the completion of a subsequent bounce. Maybe it didn't actually bounce, maybe the gear just failed there and my senses were skewed, but I am sure the initial side load had already compromised the gear because the berm isn't very big. About ½ way across taxiway Alpha, the right wing began leaving paint, so the gear had failed just prior. It all happened so fast. I felt a sense of directional control just prior to the berm, and then the airplane began turning right. I didn't realize in the moment it was because the wing was dragging, I was simply happy that I was going to make it to the ramp on a heading clear of obstacles for a safe shutdown. Then the prop struck, initially in the grass a few feet from the ramp, we spun 180° coming to rest right side up facing the opposite direction we had been traveling. It takes so much longer to write this than it does for all the thoughts to race through my head as it was happening.

Augustus does not believe that he applied brake. So I have searched for a mechanical reason a brake that was operating well to suddenly lock. We, mechanics on site, were unable to identify a problem in the brake on the wheel. Later in the day I returned to see if something had jammed in the vicinity of the brake pedal. If it did, it had dislodged. I didn't find anything. I did notice cracked paint on the floorboard at the front of the front left brake pedal, the metal under the floor board is bent in a shape that matches the brake lever and there is a mark on the back side of the brake lever. These things may indicate that the left brake was inadvertently applied very hard. It's possible an over applied left brake when beginning the slow down to stop began the event, then when the brake caused the aircraft to veer aggressively left he could have defaulted to primacy learned driving a car and subconsciously applied left brake to stop. Or, he remembers clearing his feet off the rudder pedals during the event, but that would place them in proximity to the heel brakes and again the left brake could have inadvertently remained applied. It was a dry, warm day. I've found no mechanical failure reason for the brake to lock and later release. The hobbs meter in the aircraft indicated total flight time of 1.5 hrs.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

At the moment, no brakes sounds like a good idea. But, since most airplanes have brakes, pilots in training need to be able to practice applying brakes or their training is incomplete. I have wondered, since the event, if a guard could be installed that would need to be removed before a pilot in training could have access to brakes. Then an instructor could get an airplane slowed down before giving access to the brakes to a pilot in training who needs practice learning the amount of force that is required. I considered being more structured in exchange of controls, specifically concerning brakes. But I don't think that would change the rare occasion of inadvertent application. I can wrestle back too much aileron, rudder or elevator application. I can't simply wrestle back an applied brake.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

We have not been able to find any evidence of mechanical failure.
