Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

Damage to the aircraft was significant. The wings were twisted off the fuselage, attached by maybe one attachment point. The left-hand landing gear was torn off the fuselage. Fuselage frame was broken and bent at the cockpit area. The center section containing the fuel tank was torn off the airplane. The nose section (prop and spinner) was damaged from skidding through the tree rows raised dirt beds. Photographs would be the best for a more detailed damage description to the airplane.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

While conducting a low-level agricultural application of pesticide on a hay field I experienced a sudden loss of power accompanied by a vibration while at a low AGL/above ground height in the middle of a spray pass across the field I was doing the application on. Airspeed at the time was approximately 125 to 130mph. I was doing the application in a very confined area. Confined by two sets of parallel high tension power lines running diagonally across the field I was in on a North to South flight path and a county road perpendicular to my flight path with conventional power line on wood poles running along it in front of me just beyond the high-tension wires. The application was being conducted beneath the high-tension power lines and around their steel towers. Although I had significant airspeed at the time of the power loss, I could not pitch up to exchange it for any altitude because I was just beginning to approach the high-tension power lines on an application pass, (my 8th pass in the field I was spraying) under the power lines. Pitching up would have put me right straight into the wires! I was flying too fast to land straight ahead in the distance remaining in the field I was in. Although the airplane airspeed was slowing rapidly, I believed it would be enough to carry me to the next field which was an almond orchard of short young trees directly across the road in front of me. I did not have the energy or airspeed to clear the smaller set of power lines along the road in front of me, so I flew under them and into the orchard heading due South approximately 10 or 15 feet above the ground almost out of airspeed. I attempted to eek out of what little airspeed I had remaining a very shallow turn to the west to try and get lined up with the high East and West raised dirt beds that the trees were planted on in an attempt to make a controlled landing. When approximately 45 degrees to the rows the plane settled, and a wheel or wingtip struck the ground and the airplane plowed through several of the tree rows. The airplane came to a stop with the fuselage flipped up and just past the vertical position but not completely flipped upside down. The top cockpit canopy had sprung open in the crash, so I exited out the top immediately after coming to a stop and undoing my seatbelt. The confined area and low altitude at the time did not allow any time for any cockpit assessment, emergency procedures or troubleshooting other than the obvious one, I had lost power. It all happened so fast I just had time to maintain control of the aircraft and fly under and through the worst of the obstructions in my flight path before losing my airspeed. It happened so fast I can't say with certainty what actual order the power loss and vibration were in...? Power loss then vibration or vibration then power loss I'm just not sure 100% which it was.
