Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft impacted decrepit fence on landing roll out. Both wings leading edge sheet metal dented, fuselage wrinkled, nose and left hand landing gear bent from aircraft. Aircraft yoke broken and propeller bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed Chino, KCNO, for the purpose of a pre-planned flight near the town of Apple Valley at 6:29. Prior to leaving, I added 16 gallons of fuel on top of the 12 gallons that was already in the tanks for the flight the night before and pre-flighted the plane in the morning by walking around, checking all the controls surfaces, general condition of the aircraft, the fuel, fuel sample, adding oil, the condition of the cowlings and the prop, and the condition of the wing. During my flight out there, I did not notice any issue. On my descent to 2,500 feet MSL or below, per requested by Ontario Tower to transition their airspace, I added Carb Heat after noticing symptoms similar to carb icing and left it on to be safe. At this point, I noticed I needed more power for me to maintain my altitude and airspeed compared to what I would normally use. About a couple miles away from Chino, KCNO, at I had a loss of power from 2400 RPM to around 1000-1200 RPM. At that point I was looking for a spot to land avoiding powerlines, houses, cars, and other people. I was also troubleshooting by adding full power, carb heat was already pulled, and mixture was already rich, I checked the primer, fuel selector, and made sure the mags were on both. About 15-20 seconds prior to landing, I heard the engine completely stop running and began windmilling, and the prop came to a complete stop within seconds of me landing on the fence. I hit the fence, the aircraft turned to the left and my head hit the dash. I was able to get out of the left door and signal to helicopter above that I was okay and looked for my phone to call my husband. It was at this point that I turned the mixture, master, and magnetos off and someone from the street came to make sure I was okay. Once the firefighters came and inspected the airplane, they noted fuel leaking and at that point, I remembered that I was supposed to turn the fuel selector off, so I told one of the firefighters, but I am not sure if the fire fighter did turn it off or not. The terrain in the area was pretty flat, filled with power lines, houses developments, and farm fields.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I would recommend, pending what happened, adding carb ice sooner in the descent. The 150 is known for carb icing, and given the haze outside I should have applied carb heat as soon as I began descending from over Cajon. I applied carb heat as soon as the RPM descended out of the green arc. From now on I will apply carb heat on any descent regardless of rpm when there is visible haze or moisture. To prevent the possibility of it being fuel related, I would have taken greater than the one hour of reserve planned for and used a greater safety margin. In all future flights I will plan for a 20% discrepancy from book numbers. When I landed there was fuel draining from the crash, and there was haze visible which leads me to believe a combination of factors is possible.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No
