

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Enterprise State: OR

ZIP: 97828 Country: USA

Latitude: 45.42426 Longitude: -117.26374

(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 09/02/2021 Local Time: 12:00 PM

mm/dd/yyyy

Time Zone: PDT

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: 3965S

Manufacturer: Cessna

Model: 172E

Serial Number: 17251165

Year of Manufacture: 1964

Amateur-Built: ☐ Yes ☒ No If Yes: ☐ Kit/Plans ☐ Original Design Make: _____

- ☐ IFR-Equipped and Certified
☐ Commercial Space Flight
☐ Unmanned Aircraft

Maximum Gross Weight: 2300 lbs

Weight at Time of Accident/Incident: 1850 lbs

Number of Seats: _____ Flight Crew Seats: _____

Cabin Crew Seats: _____ Passenger Seats: _____

Number of Engines: _____

Category of Aircraft

- ☒ Airplane

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

There was no damage to the runway or runway border area. The plane's nose wheel collapsed as the plane settled onto the front gear after landing. The plane also flipped as it left the runway. The airplane is intact but will be likely be called a total loss by the insurance company.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

My wife and I left 8S4 around 7:00 AM PDT for a trip to OR8, Dug Bar, on the Snake River for a morning of bass fishing. The 33.3 nautical mile trip was uneventful. After fishing, we left OR8 at approximately 11:30 AM PDT. Because the dried grass runway is a little rough, I kept the nose in a high position throughout the take-off roll to protect the nose wheel. About 5 knots before lift off, I felt a bump that was a little different from the normal sounds made by a grass strip. There was nothing in my view that was out of the normal, such as a rock or badger hole in the runway. Within a few seconds from the noise I was airborne. After becoming airborne, I looked at my main gear and asked my wife to do the same on the right side. They looked normal. I have landed at OR8 many times in the last year, and it is not uncommon to hear some bumps and thumps as you travel over the runway surface, just as it is with any back country airstrip.

The flight to 8S4 was also uneventful. I entered left downwind for 30 after looking at the sock (no wind) and turned left base and final. The plane touched down lightly in a full stall landing just after the numbers in the center of the runway. The plane rolled smoothly on its main wheels for a couple seconds. As the aircraft slowed and the nose wheel engaged the ground, the landing suddenly went terribly wrong. The nose wheel collapsed, and I was pulled hard to the left. I pushed the right rudder in and applied full brakes to the right wheel. At this point there was no controlling the plane. The plane continued to veer to the left, exited the runway and flipped forward onto its back. My wife and I were not injured. A person living near the airport heard the noise, saw the wreckage and called 911. Emergency services arrived and looked over the crash site, visited with us, took statements, and finally left. I called the NTSB and received permission to remove the plane. The owner of the airport brought his crane truck over, and we righted the plane and moved it to the hangar.

The next morning, the owner of the airport and I flew to OR8 to look at the runway for problems with the runway surface that could have caused the accident. There were none. We also looked at my tracks from take-off. They were easy to see in the dry dusty conditions, and we think only one plane had been there since I took off the day before. My nose gear and main wheel track rolled down the runway in a normal way for the first half of the runway. Just after the half way mark, the nose wheel tracks changed to a scuffing dragging track with no tread showing. The airplane was almost airborne by this time. There were about 8 short scuff marks over a distance of approximately 100 feet, then one last final scuff mark. From that point the plane was in the air.

Upon examination of the collapsed nose gear, I found the upper torque link completely broken. I believe the torque link broke during the take off at OR8. When the torque link breaks, it allows the gear to extend fully, and the nose wheel is free to rotate 360 degrees. Fortunately, I had a nose high attitude and was just about airborne when the torque link failure occurred. There was very little weight on the nose of the plane, and it just scooted along without trying to dig into the ground. When I landed at 8S4, the nose gear was extended as far as the cylinder would allow and the wheel was rotated far to the left, possibly almost at a right angle to the flight path of the plane. After landing, as the aircraft settled onto the nose, the plane quickly changed course to the left and the gear collapsed.

I have documented this entire history with a number of photos that have been sent along with this document.

I believe this accident was caused due to a mechanical failure and was not caused by any actions on my part.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Since there were no obstacles hit with the nose gear when taking off at OR8, I think the upper torque link failure was due to fatigue over the life of the 57 year old airplane. In the last 8 years this plane has landed at many back country strips including a grass strip used at our own farm. These off airport landings could have certainly accelerated the fatigued torque link more than landings on smooth asphalt.

I believe the torque link and entire nose gear structure should be checked often for evidence of metal fatigue and cracks. A thorough check should be performed during the annual inspection.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Upper torque link on the nose gear.
Cessna Part # 0442506-1

This link was broken into two pieces. All pivot points of the upper and lower torque link were free. See pictures for details. Cessna made both a heavy duty and regular duty nose gear, but both models used the same upper torque link.
