NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 8/27/2021 at approximately 1619 hours two hikers, who had decided to hike the trails around Pine Mountain near Camp Verde, called the Yavapai County Sheriff's Office to report they were feeling dehydrated, and were having difficulty with the hike. The hiking party was running out of water and were concerned about their ability to finish the hike.

At approximately 1730 hours I, Jeff Newnum, spoke with our Search and Rescue Coordinator and determined that we could launch our helicopter to attempt to rescue the two hikers from Pine Mountain. I proceeded to the Prescott Airport (KPRC) and conducted a pre-flight of the aircraft, a Robinson R44 Raven II (N544SH). I took off from the airport between 1800 and 1830 hours. I flew to the area of Dugas road which is just west of Pine Mountain. I landed in a field to the east of the community of Dugas where I met with the Yavapai County Sheriff's Office Search and Rescue Coordinator to pick up water for the hikers needing assistance.

After picking up water I flew to the last known coordinates (N34.3256 W111.8364) of the hikers. Which, according to the information given was an elevation of 5140 feet. The hikers were located at the top of the ridge near N34.2884 W111.7912. I was able to locate the hikers and began a process of scouting the area for a possible landing zone. I flew the area for approximately 30 minutes and found a landing zone just north of the hiker's location. The landing zone was located at N34 17.46 W111 47.31. The landing zone had a slight slope and consisted of small to medium size rock and grassy type vegetation. While flying the ridge of the Pine Mountain area I noted the winds coming from the easterly direction seemed to be creating some turbulent air as they crested the ridgeline. The sun was still visible in the sky when I landed at the landing zone. After shutting down the helicopter, I gathered the water in a pack and hiked to the area where I had spotted the hikers. I contacted them and supplied them with water to prepare them for the hike back to the helicopter's location. The female hiker appeared to be very tired and in need of water. A conversation was had about their options, and the decision was made to fly the party out of the area.

At approximately 1930 I led the party back to the helicopter. The sun was setting at this point. When we arrived back at the helicopter, I again asked both parties to hydrate some more. I loaded the female passenger in the backseat with the party's gear and the male passenger in the front left seat. I conducted a preflight and noted the temperature was approximately 20 degrees Celsius. Before loading the passengers I calculated my 5 min Max Takeoff Power to be 24.1 inches of mercury, and maximum continuous at 21.3 inches of mercury. As I picked up into a hover I was focused on the slope of the landing zone due to the medium sized rocks that the helicopter was resting on. As I picked up I was within the maximum takeoff, however once the skids were between 3-5 feet off the ground I felt some turbulent air and immediately felt the decay of the rotor system. The rotor RPM began to decay slowly and steadily. The helicopter was moving forward slowly, and I immediately decided to lower the collective, roll off the throttle and flair the aircraft to cushion a forced landing. The aircraft came to rest approximately 20-30 feet from the original location of the landing in an area with significantly larger rocks, simultaneously able to control the speed of the rotor and lift the skids to position and ensure the aircraft was balanced and sitting on solid ground before shutting off the engine. During the landing the main rotors contacted the trees at the landing site. After picking up from the landing zone, the entire incident seemed to last less than 20-30 seconds in my estimation. The damage to the helicopter appeared to be the main rotors hitting some trees upon landing. I am unsure of any internal damage to the transmission or engine, however it was evident I was still able to control the speed of the main rotor with the throttle upon landing the helicopter.

After the landing, I ensured both passengers exited the aircraft and moved away from the helicopter. Both parties reported that they were fine and did not feel injured in any way. I contacted our Search and Rescue Coordinator and let him know that the helicopter was "down" due to a forced landing and that all parties were uninjured. I asked the SAR Coordinator to have the Yavapai County Sheriff's Office dispatch center notify the NTSB immediately of the incident, and to launch Arizona Department of Public Safety (DPS) helicopter to assist in a rescue.

I continued to check the welfare of both hikers while we waited for a rescue from DPS. Both parties assured me they were ok, and not suffering from any injury. We waited at the landing zone for quite some time before DPS Ranger 1 arrived overhead on scene. DPS began assessing the situation and flew for several hours on this night trying to set up for a hoist operation. Eventually DPS decided that due to the conditions they were not able to conduct a hoist operation. DPS did offer to try and conduct a potential "one skid" landing, however I cancelled that option with our Search and Rescue coordinator because I felt the conditions had proven themselves to be too risky.

At this point in time, which was probably an hour or two after the forced landing, I explained to the hiking party that I would be assisting them down the mountain on foot. That I felt a rescue by helicopter was proving to be too risky for everyone involved and I did not feel

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This accident could have been avoided by taking more time to calculate and determine the density altitude and out-of-ground effect on the helicopter at the time of the accident.
