Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Engine and propeller destroyed. Other damage to the airframe seems likely but I'm uncertain of what that is.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This accident occurred on the fourth load of skydivers for the day. All four loads were flown consecutively without shutting down in between. The first three loads were routine. On the fourth run, I had verified at least 300 lbs of fuel were in the tanks according to the fuel gauges, and the taxi, take off, and climb were routine. The skydiver jump run at 13,000 feet was routine.

The descent followed a standard profile, and was begun at power idle stop and around 110 knots IAS, with the propeller in a flat, high drag pitch to aid quick initial descent. During the base, around what I estimate as 4000 feet and a descent rate of 4500 fpm, I advanced the thrust lever to start slowing descent for a stable approach. At this time, the first indication of a problem was noticed. Upon advancing the thrust lever, I noted there was no responding increase in thrust. I spent the next moments adjusting the thrust lever and propeller speed lever trying to get some response, but there was still no apparent increase in thrust or response from the propeller. After another few moments of shock, I decided I must have a flame out of the engine, and took steps to restart the engine. The propeller was spinning, still creating a very large amount of drag on the front of the airplane, so I turned ignition to "CONTINUOUS" and I turned the fuel boost pump to "ON". I checked the fuel gauges and noted that they indicated at least 100 lbs (the gauges usually read low in a idle descent so I assumed there was more). During this time, I was trying to raise the nose of the aircraft to slow descent, but I could not. I dialed in full nose up trim and was pulling back on the yoke to the stops, but could not raise the nose or slow descent rate substantially. A moment after I had turned the ignition to "CONTINUOUS" and the fuel pump to "ON", I remember noticing the TORQUE indication jump to around 20% and I thought I had restarted the engine. I advanced the thrust lever and there was once again no responding increase in thrust. At this time I recall noting an RPM of 0 on the tachometer, which confused me because the propeller was spinning.

I noticed I had drifted close to the approach end of the runway, at an estimated 1500 feet, and was too high to land on it without risk of overshooting, so I started a right 360 degree turn (NOTE: the low level ads-b data I've seen on various Internet sites does not represent this right turn, and that data is not accurate according to my recollection). I decided not to make a radio call due to saturation fighting for control of the plane. Still unable to arrest descent, around this time I warned the observer of our predicament, and that the engine was lost and he needed to prepare himself for a possible hard landing. I recall lowering the flaps to full, as I continued to troubleshoot the engine all the way down to the ground. I was maintaining 90-100 knots indicated, and the wing was not loaded past approx 1G, in a "best glide", which was still giving me a very high descent rate. I believe this rapid descent was due to the overwhelming propeller drag on the nose, killing glide performance and pitch control of the plane. I fought for pitch control and a decrease in descent rate, while trying to get the engine to fire up, all the way down to the hard landing in the dirt.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

The engine was either not running, or unresponsive in an idle or beta power setting. I've wondered, in hind sight, if it's possible the governor was malfunctioning, or the propeller blades were back on the feathering-stops.
