Bent elevator balance horn.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 7/28/22, I, Trooper Steven Cantine, was participating in a Public Aircraft Operations (PAO) flight training exercise in the Wrangell Mountains near McCarthy. I was flying Piper Super Cub N82735 as Pilot in Command (PIC), and Justin Rodgers was acting as the Department Check Pilot in the rear seat. After a full-stop landing and shut-down on an unimproved strip at Young Creek Lake, I attempted to take-off but was forced to abort the take-off.

Prior to re-entering the aircraft, I selected an abort point on the runway. I started up and taxied to my planned turn-around point at the end of the strip. I had noted the appropriate mixture lean for the aircraft during flight, and I set the mixture the same for take-off, given our high altitude (strip was approximately 3500' MSL). After turning around, I initiated a take-off roll at approximately 1205 hours. Shortly before we reached the abort point I was able to raise the tail off the ground. Due to high density altitude, the aircraft was unable to gain sufficient airspeed on the strip to clear the willows at the end of the strip. I aborted the take-off, and the aircraft came to rest off the end of the strip. No injuries were sustained by Rodgers or myself; after shutting the aircraft down and exiting the aircraft, I determined that the right elevator balance horn was bent. The aircraft was moved by hand back onto the strip.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This aborted take-off occurred due to a combination of high density altitude and short strip. The effects of density altitude were considered prior to landing; however, the strip was found to be rougher and softer than was initially determined during the aerial strip evaluation. A take-off could have been conducted without a second occupant in the rear seat, which would have shortened the take-off roll and improved climb performance.
