Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Rotor Blades and propeller are destroyed beyond repair. Motor mount is broken (cause of crash). Much of the Airframe still awaits full inspection once it is cleared for disassembly.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On August 13, 2022 after a thorough pre-flight inspection of 532KB I taxied to run up area, then active runway 25 departing Corona (KAJO) around 11:45AM for left closed traffic. Weather was typical for Corona in August, skies were clear and there was light wind directly on runway heading. Take off, Crosswind, downwind, base, and final turn were normal. Shortly after final turn on long final I heard and felt a BANG and lost power. I immediately pitched down to maintain cruise speed and called engine out on the CTAF. I found myself descending in a barely controllable spin. I had rotor control but still spun. I attempted a descent toward a construction site directly below. Just before impact I flared and righted the gyro to land flat. The gyro hit the dirt while traveling in a backwards direction, stopped and flipped sideways due to the momentum of the spin I was in and the hard landing, and came to a stop after a few rotations of the rotor blades on the ground. I undid my harness, removed myself from the craft, and radioed in I was OK. I was checked and cleared by emergency services near the crash site. After being cleared by the NTSB to relocate the Gyroplane, a visual inspection showed it was clear that the motor mount sheared near the engine mounting bolts and dropped several inches causing the propeller to strike the keel tube, severing the right rudder cable which ran along side of it, causing me to enter a left handed spin. Photos of craft and video of flight included with report.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I would recommend that any craft with KB style light weight engine mount replace said mount with something more rugged and durable. The cross bars that failed are mounted directly to the engine with no vibrational isolation mounts and clearly have a limited life under said vibration. The shear breaks happened very closely (just on the outside) of the engine bolt mounts. In my uneducated opinion this break was caused by over stressing this mount either via the vibration of the engine under load, over torquing the bolts mounting the engine, or the combination of the two.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Engine Mount, Cross Post bars direct mounted to the 532. Visually Inspected with no obvious damage on preflight prior to flight.
