Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

No damage to other property. Aircraft engine, engine mounts, prop, front cowling, fusepage, wings, Vertical stabilizer, Horizontal stabilizer, main landing gear, nose landing gear, doors, baggage compartment door, various plastic windows, Instruments, autopilot, strobe light. Insurance company will probably consider the aircraft a total loss.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Being as a primary concern for an engine failure would be its fuel supply, I wanted to provide the following background:

There are four fuel level indicator instruments on board N2994X: There are two original equipment Cessna fuel gauges, which have never worked properly. The aircraft has a Fuel Scan 450 and a JPI EDM-830 which are both extremely accurate, as long as they are reset upon refueling. The fuel quantity feature on the EDM-830 has only recently been added to the instrument, and I am still getting used to its operation.

On 11/25/2022, I topped off the fuel tanks at KCCB (Cable) giving the aircraft 48 useable gallons of fuel. I reset the Fuel Scan 450 and I pressed the top-right "Refueled" button on the EDM-830 after engine startup, for a flight to KHII (Havasut) that day. The one thing that I neglected to do, was press the left-top "Save" button on the 830. Therefore, when the 830 reverted to Step mode, it did not display the correct fuel amount of 48 gallons. However, the Fuel Scan 450 did accurately display the correct amount of fuel on board the aircraft. I used 14 gallons of fuel on my flight to KHII that day, leaving a remainder of 34 gallons of fuel in the aircraft upon arrival at KHII.

On 11/27/2022, my wife (Jean) and I decided to fly to KSEZ (Sedona) for lunch. I filed a Flight Plan showing 33 gallons of fuel on board, at the beginning of my flight, in order to give myself an extra gallon or reserve fuel. I did not top off the fuel tanks at Havasut prior to departure, as the fuel price was much less at KSEZ. I planned to top off the tanks at KSEZ. I had made the flight to KSEZ a number of times previously, and knew that the aircraft would only use about 12 gallons of fuel during such a flight, which should leave approximately 21 gallons of fuel left, upon my arrival at KSEZ.

My wife and I departed KHII on runway 32 at 12:45 pm on 11/27/2022. I had filed a flight plan showing a cruising altitude of 7,500 feet. However, I ended up climbing to 9,500 feet to take advantage of a better tailwind at that altitude.

Every Detail of the aircraft's direction and altitude is shown on Flight Aware's Flight Tracking Log (please see attachment 9-B). I engaged an AeroCruz 100 autopilot during my initial climbout. About three minutes into the flight, I disengaged the autopilot, and entered different settings and climb rates into the unit, in order to gain greater familiarity with the unit, which is reflected in the Flight Tracking Log.

It is difficult to reach any of the ARTCC's below 7,500 feet in this area. My initial contact was with LA Center, when I reached approximately 7,500 feet. I was issued a Transponder frequency, and was almost immediately instructed to contact Albuquerque Center. Upon contacting ALB CTR, I was issued a different frequency.

There was a good deal of static on the ABL CTR frequency (at my altitude). I thought I understood the controller to issue me yet another frequency, so I read back the frequency number, and changed my transponder accordingly. About 30 seconds later, the controller informed me that the frequency I read back was for another aircraft, and I should return to the frequency he had given me earlier. I read the numbers back to him, and changed my transponder again.

I leveled off at an indicated 9,500 feet. Nice day, nice flight, no turbulence, no clouds, that I remember. About 9 or 10 minutes into the flight at this altitude, the engine lost power. ALB CTR had just made a communication with me, which I did not respond to, as I was looking for a likely place to land while trying to get the engine restarted. About ten seconds of silence went by, before ALB CTR contacted me again. I informed him that my engine had lost power, and I was trying to restart.

My first assumption was that I might have been running too lean (although I had been slightly rich of peak). I circled back toward the possible landing area that I had seen, while trying various mixture and throttle settings. There was no sputtering from the engine...it never tried to come back to life. The propeller was windmilling, but the engine made no attempt to restart.

Please see attachments 9-A through 9-D for additional narrative.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I have no lead what might have caused this accident. Therefore, I have no suggestions to make.
