Re: N38C

To Whom It May Concern:

It was a normal Sunday, April 16, 2023. Weather conditions were good for a VFR pleasure flight. I performed a normal preflight. I then taxied to the run-up area and performed a normal run up. I noted no abnormalities. Found aircraft in standard operating condition. I performed a normal takeoff, and I performed a normal climb out with no abnormalities noted. Thus, went for a short flight over Cajon Pass.

Upon returning to Cable, aircraft appeared to be functioning normal; all factory instrumentations were in the green. At my normal gear extension location on the downwind leg, I noted no green light. And then the recycled gear noted gear to be down, but gear doors felt like they were open, due to drag felt.

Went to emergency gear checklist, which told me to use emergency gear extension pump. Noted gear pump handle had high resistance which indicates to me high hydraulic pressure indicating gear down, but I knew gear doors were not closed due to excessive drag felt. At this time, I did a low pass over the runaway asking if anyone could see my gears down and locked but I heard no response. So, I elected to land because I felt like it was the safest decision.

Upon landing added drags with gear doors open made the flare extremely difficult. Upon touch down, nose and left main gears collapsed.
