

NATIONAL TRANSPORTATION SAFETY BOARD

NTSB Form 6120.1

PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

Email the pilot/operator aircraft accident/incident report to the investigator-in-charge of your accident/incident. If email is not available, mail the report per the instructions below.

If your accident/incident occurred in Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Mississippi, Alabama, Georgia, Florida, the District of Columbia, Puerto Rico, or the US Virgin Islands, send the form to: NTSB, ERA, 45065 Riverside Parkway, Ashburn, VA 20147.

If your accident/incident occurred in Ohio, Michigan, Indiana, Wisconsin, Illinois, Minnesota, Iowa, Missouri, Arkansas, Louisiana, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Texas, Colorado, or New Mexico, send the form to: NTSB, CEN, 4760 Oakland Street, Suite 500, Denver, CO 80239.

If your accident/incident occurred in Montana, Wyoming, Idaho, Utah, Arizona, Nevada, Washington, Oregon, California, Hawaii, or the territories of Guam or American Samoa, send the form to: NTSB, WPR, 505 South 336th Street, Suite 540, Federal Way, WA 98003.

If your accident/incident occurred in Alaska, send the form to: NTSB, ANC, 222 West 7th Avenue, Room 216, Box 11, Anchorage, AK 99513.

Rules pertaining to notification of aircraft accidents and incidents, as well as overdue aircraft are found in 49 Code of Federal Regulations (CFR) Part 830 http://www.ecfr.gov/cgi-bin/text-idx?c=ecfr&tpl=/ecfrbrowse/Title49/49cfr830_main_02.tpl. These rules state the authority of the NTSB, define accidents, incidents, injuries, and other terms, and provide procedures for initial and immediate notification of accidents and incidents by aircraft pilots/operators.

A. APPLICABILITY

The pilot/operator of an aircraft shall send a report to the office listed above, based on accident/incident location; immediate notification is required by 49 CFR 830.5(a). **The report shall be filed within 10 days after an accident for which notification is required by Section 830.5, or after 7 days if an overdue aircraft is still missing.**

An aircraft accident, as defined in 49 CFR 830.2, is determined as an occurrence that involves a fatality or serious injury, or substantial damage to the aircraft. For occurrences that do not involve a fatality, the determination that the occurrence is an accident can be appealed by writing to the Director, Office of Aviation Safety, NTSB, 490 L'Enfant Plaza, S.W., Washington, D.C. 20594.

INSTRUCTIONS TO PILOTS/OPERATORS FOR COMPLETING THIS FORM

It is necessary that ALL questions on this report be answered completely and accurately.

If more space is needed, continue on a blank sheet of paper.

Nearest City/Place: Use the name of the nearest community in the state where the accident/incident occurred.

Date/Time: Indicate the date and local time of the event. Be sure to indicate the time zone.

Phase of Operation: Indicate the phase of operation during which the accident/incident occurred.

Aircraft Information: Enter aircraft make and model information as indicated on the aircraft registration certificate, including series. If the involved aircraft is certified as "amateur-built," include the name of the producer of the kit or plans, unless an NTSB employee instructs otherwise.

Maximum Gross Weight: Enter the certificated maximum gross weight for the aircraft involved in the occurrence. This should be the same as the maximum gross weight indicated on the aircraft weight and balance documents.

Engine: Enter engine make and model information as indicated on the engine data plate.

The NTSB uses this form for aircraft accident prevention activities and for statistical purposes. NTSB regulations (49 CFR Part 830) require that **ALL** questions be answered completely and accurately. Completion of this form will take approximately 60 minutes. The NTSB does not guarantee the privacy of any information provided in this form. You need not complete this form unless it displays a valid OMB control number, in accordance with 5 C.F.R. § 1320.5(b), which applies to this collection of information.

B. DEFINITIONS

1. "Aircraft Accident" means an occurrence associated with the operation of an aircraft that takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death, or serious injury, or in which the aircraft receives substantial damage. For purposes of this form, the definition of "aircraft accident" includes "unmanned aircraft accident," as defined at 49 CFR 830.2.

2. "Substantial Damage" means damage or failure that adversely affects the structural strength, performance or flight characteristics of the aircraft, and that would normally require major repair or replacement of the affected component. NOTE: Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairing or cowling, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wing tips are not considered "substantial damage" for purposes of this report.

3. "Operator" means any person who causes or authorizes the operation of an aircraft, such as the owner, lessee, or bailee of an aircraft.

4. "Fatal Injury" means any injury that results in death within thirty (30) days of the accident.

5. "Serious Injury" means any injury that (1) requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received; (2) results in a fracture of any bone (except simple fracture of fingers, toes, or nose); (3) causes severe hemorrhages, nerve, muscle, or tendon damage; (4) involves injury to any internal organ; or (5) involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

Type of Fire Extinguishing System: If a fire extinguishing system was used to fight an aircraft fire, specify the type(s) of extinguishing system(s) used. Examples include handheld extinguisher, engine fire bottle, cargo/baggage compartment fire suppression system, or airport emergency ground equipment.

Owner/Operator Information: Enter the owner information as shown on the registration certificate. Commercial operators, enter the operator information, including "doing business as" when applicable, as shown on the operator certificate.

Revenue Sightseeing Flight: Indicate whether the accident aircraft was conducting revenue sightseeing operations under 14 CFR Part 91 at the time of the accident.

Air Medical Flight: Indicate whether the accident flight was being conducted for the purpose of carrying medical personnel, patient(s), or organs.

Public Aircraft: Federal, state or local government flight operations such as official travel, law-enforcement, low-level observation, aerial application, firefighting, search and rescue, biological or geological resource management, or aeronautical research. Indicate whether the flight was conducted by the armed forces, federal, state, or local government.

Purpose of Flight: 14 CFR Parts 91, 103, 133, 136, and 137: Indicate the type of operation that was being conducted at the time of the occurrence using the following definitions:

AERIAL APPLICATION--Operations using an aircraft to perform aerial application or dispersion of any substance. Examples include agricultural, health, forestry, cloud seeding, firefighting, insect control, etc.

AERIAL OBSERVATION--These flights include aerial mapping/photography, patrol, search and rescue, hunting, highway traffic advisory, ranching, surveillance, oil and mineral exploration, criminal pursuit, fish spotting, etc.

AIR DROP--Aerial operations, other than aerial application, that are intended to release items in flight.

AIR RACE/SHOW--Includes any flight operations conducted as part of an organized air race or public demonstration.

BUSINESS--includes all personal flying without a paid professional crew for reasons associated with furthering a business, including transportation to and from business meetings or work. This does not include corporate/executive operations, air taxi, or commuter operations.

EXECUTIVE/CORPORATE--Company flying with a paid, professional crew.

FERRY--Non-revenue flight under a special flight or "ferry" permit. Refer to 14 CFR 21.197 for details of special flight permit issuance.

FLIGHT TEST--Flight for the purpose of investigating the flight characteristics of an aircraft/aircraft component or evaluating an applicant for a pilot certificate or rating.

INSTRUCTIONAL--Flying while under the supervision of a flight instructor or receiving air carrier training. Personal proficiency flight operations and personal flight reviews, as required by federal air regulations, are excluded.

OTHER WORK USE--Miscellaneous flight operations conducted for compensation or hire such as construction work (not 14 CFR Part 135 operation), parachuting, aerial advertising, towing gliders, etc.

PERSONAL--Flying for personal reasons (excludes business transportation) including pleasure or personal transportation. This also includes practice or proficiency flights performed under flight instructor supervision and not part of an approved flight training program.

POSITIONING--Non-revenue flight conducted for the primary purpose of relocating the aircraft. Examples include moving the aircraft to a maintenance facility or to load passengers or cargo etc.

UNKNOWN--Use only if the primary purpose of flight is not known.

Other Aircraft--Collision: For all accidents involving a collision with another aircraft, including parked aircraft, check "Collision with other aircraft" under Basic Information and complete this section indicating details about the OTHER aircraft involved in the collision.

Airport Information: Complete this section if the accident/incident occurred on approach, landing, takeoff, departure, or within 3 statute miles of an airport. Please refer to the FAA Airport/Facility Directory or other official source for airport information.

Airport Identifier: Provide the official 3 or 4 character airport identifier number.

Runway: Indicate the number of the runway used, including L, R, or C if applicable.

Runway/Landing Surface: Indicate the type of intended runway/landing surface (do not indicate surface conditions). If the surface type was mixed, check all that apply.

Condition of Runway/Landing Surface: Indicate the condition of the intended runway/landing surface. If multiple conditions existed at the time of the accident, check all that apply.

Weather Information at the Accident/Incident Site: Indicate the weather conditions reported at the accident/incident site at the time of occurrence. If no weather reporting was available for the accident/incident site, indicate the reported conditions at the nearest reporting site. Specify the weather reporting site identifier, the observation time, and distance from the accident/incident.

Sky/Lowest Cloud Condition: Indicate the height above ground level of the lowest cloud condition present at the time of the accident/incident and whether coverage was reported as few, scattered, broken or overcast. Also indicate the height above ground level and coverage of the lowest cloud ceiling present at the time of the accident/incident (reported as broken or overcast).

NOTAMs (D and FDC), AIRMETs, SIGMETs, PIREPs: Describe all NOTAMs (distant (D) or Flight Data Center (FDC), if known), AIRMETs, SIGMETs, and PIREPs in effect near the accident/incident.

Flight Crewmember Information: Indicate the category that best describes the capacity served by this flight crewmember at the time of the accident. The designators "Flight Crewmember 1" and "Flight Crewmember 2" do not refer to a specific pilot position or responsibility. If more than one pilot is aboard, they may be entered in any order and their capacity entered as appropriate.

Degree of Injury: See Definitions on the top half of Page 1 of the instructions. Minor injury is not defined. If an injury does not meet the criteria for another injury category, select Minor.

Date of Last Flight Review or Equivalent: Enter the date of the most recent flight review, or equivalent, completed by this pilot. Refer to 14 CFR 61.56 for accepted equivalents.

Type Ratings: List all type ratings on the pilot certificate. If the pilot holds no type ratings indicate "none." If the pilot holds a pilot certificate other than student and was flying an aircraft requiring an endorsement, enter the type and date of any logbook endorsement(s) for that aircraft. See 14 CFR 61 for examples of required endorsements.

Student Endorsements: If the pilot holds a student pilot certificate, enter all solo endorsements and dates on the student pilot certificate.

Flight Time: Complete the flight time matrix. Solo flight time should be included as "Pilot-in-Command (PIC)" and all dual flight instruction given should be included as "Time as Instructor."

Additional Flight Crewmembers: Complete this section if there were more than two required flight crewmembers on the aircraft. This also includes a check airman performing official duties but does not include cabin crew. State the capacity served by each included crewmember at the time of the accident.

Passenger(s)/Other Personnel: Enter identification and injury severity information for all passengers, cabin crew, and other personnel involved in the accident. See Page 1 of the instructions for the official definition of injury levels.

Several questions throughout the form allow for multiple responses; when appropriate, choose all responses that apply.

These instructions only pertain to major issue areas covered by NTSB Form 6120.1 Pilot/Operator Aircraft Accident/Incident Report. For additional definitions of questions and responses, please refer to www.nts.gov.

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

All of the wheels were ripped off of the plane. Scratches and 8 inch long scraped punctures were created on the bottom of the fuselage from sliding on the ground. Scratches were also made from bushes on one wing as well as some scratches on the bottom of the horizontal stabilizer. One of the 3 props was broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Frederic, with my instruction was to practice power off 180 and other landings that day. We had practiced power off 180s together around 10-15 times on previous days. Winds were forecast light and variable also though I had flown earlier that day and recalled to Frederic that earlier the three wind socks on the runway blowing in 3 different directions and wind was more than light (probably more like 8 kts). On my first takeoff with Frederic, the winds were calm.

We had taken off runway 1 and were cleared to stay in the right hand pattern to do touch and goes. We did one soft field landing with no problem. Wind was variable during landing.

We took off and downwind midfield we requested a short approach and was cleared for a short approach. Frederic's target was to touch down at the beginning of the aiming point markings. I knew he was going to be short of his mark but I did not guide him too much as his check ride was coming up soon and we were trying to get him to succeed at these landings on his own, without me coaching him the whole way. His airspeed was appropriate the whole way to the runway (65 knots for the most part for best glide). As we were lined up and over the displaced threshold and approaching the runway I suggested that he uses flaps to give the plane a little more lift to extend the landing a bit while in ground effect. We were still in the upper 50kts indicated airspeed. Stall speed is 44 knots with flaps retracted and 38 knots with full flaps.

We then seemed to quickly lose airspeed and lost lift about 20 feet above the runway as we came down very hard and flat. Frederic did start his round out slightly too high, but it was not excessive. We touched down a couple hundred feet past the threshold in the center of the runway. The landing had an almost 'crunchy' sound to it. At the moment we touched down, Frederic instinctively applied full power in an attempt to do a go around. Regarding the flaps, I cannot be sure if they were ever fully put down or not (I have seen Frederic and other students in the past accidentally put flaps back up while their hand is over the throttle, as the flap switch is right next to the throttle and on a bumpy day one could accidentally flip up and retract all the flaps). We were not climbing or accelerating and we were drifting to the right. I then took controls and continued to attempt to go around while keeping the pitch down in an attempt to see if the plane would accelerate, which it would not more than 50 knots. I then thought that the landing might have been so hard that one of the propellers could have clipped the runway and been damaged. I did not think it would be wise to continue trying to fly with a potentially broken propeller while drifting further and further off the runway, so I pulled the throttle and landed in the direction we were heading (10-20 degrees to the right of runway heading), just about 2-3 feet to the right of the runway. I didn't not attempt to turn in the air too much to get back on the runway because I did not want to potentially stall in a bank at such low altitude. After we touched down to the right of the runway I did not attempt to steer too much with the rudder as we were going too fast to turn, and we were heading down a slope, so I did not want to flip the aircraft over on one of its wings. I did apply maximum braking though and we ended up being stopped by thick desert bushes. We then secured the engine and turned off the master switch and exited the airplane.

I now believe that wind shear may have played a large role in the initial hard landing on the runway as our airspeed apparently dropped so dramatically fast.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

We feel the CFI mis-judged when he should have taken control to avoid a hard landing. CFI should have taken controls earlier, either to control the airplane for a better landing or to perform a go-around. Subsequently, we decided that Mr. Smith would be re-evaluated with Mr. Birtell (flight school chief pilot) on the maneuvers performed and ensure instructional proficiency. Once we're satisfied that he can perform safely post-accident, we will release him to normal flight status. His actions after the hard landing are understandable given the situation and we feel that his decision to abort the go-around and not to take an aircraft of unknown condition back into the air was a display of good judgment. It should also be noted that the CFI's attitude post-accident has been commendable and appropriate to enforcing a culture of safety. Although Mr. Hewitt was not the PIC he was likely the pilot flying that resulted in the hard landing. We decided to also fly him with another instructor to ensure his landings will be observed for any deficiencies to help mitigate risks as well.

EVACUATION OF AIRCRAFTWas an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

Instructor exited the left door as he was sitting in the left seat because he was training a commercial student pilot who wanted to do CFI training shortly after gaining commercial certificate. The student in the right seat could not exit his door as a bush was blocking it from opening. So the student also exited from the left seat.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

THE FOLLOWING WAS WRITTEN BY FREDERIC HEWETT

I was the pilot receiving dual instruction from Auguste Smith on April 26 in the afternoon. We were practicing commercial landings on Runway 1 at Glendale Airport KGEU around 4pm in the afternoon (2300z). I was in the right seat and Auguste was in the left seat. I practiced a soft field landing with no incident and then on the second landing requested and was approved for a short field approach for a power off 180 landing. There was nothing out of the ordinary on my way down to the runway. I made my base to final turn, maintaining a best glide of 60-65 knots with no flaps. I aimed for the touch down markers and knew I was going to land short a few hundred feet of my target, though I was well past the runway threshold and safe. Auguste suggested I use full flaps to try and stretch a little extra distance in ground effect. I don't remember whether I actually put in flaps or not. I had normal sight picture as I rounded out above the runway. I believe I still had excess airspeed left to bleed and did not feel an impending stall but then we slammed down harder than I ever had up to that point in my training. My first instinct was to apply full power and go around. Auguste jumped in to take over controls, as he believed we had damaged the landing gear. I let him take over and he soon cut power and opted to brake straight ahead. We veered to the right off the runway and Auguste focused on keeping us wings straight and level. I braced for a possible nose flip, but we came to a safe stop in the bushes, where I followed the emergency landing checklist and shut off the fuel tank and avionics prior to exiting the aircraft. I was unable to dial up control tower in the moment. Neither of us were injured and we stood by the aircraft waiting for assistance.

The weather conditions were warm and clear skies. Winds were variable at 3 knots. I suspect possible wind shear might have been a factor as I don't feel I stalled that high above the runway and Auguste did not note anything off with my approach. Prior to takeoff, Auguste noted during engine runup that he saw three windsocks pointed in different directions (not blowing at the moment).

Also, it was my first time in that particular plane Light Sport N76GX (I had been training mostly in N16GX for my commercial check ride for almost 10 hours). The engine had some 450 hours on it and three propellor blades so it handled more powerfully than what I was used to.
