NARRATIVE HISTORY OF FLIGHT <i>(Please type or print in ink)</i> Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible. On the morning of the incident, I was well-rested, felt physically and mentally fit for the planned flight. Weather / turbulence forecast data obtained with ForeFlight the night before were confirmed in the morning and supported the decision to go forward with the flight. At the airport (UT9), the hangared aircraft was rolled out and pre-flighted. Passenger was briefed on safety procedures before boarding. I was in the front seat as PIC, my passenger (a non-pilot) was in the back seat. I started and warmed the engine up to operational temperature, went through the pre-flight in-cockpit checklist. At 06:08 UTC-6, we departed UT9 on a VFR flight to KBCE, climbing stepwise to 11,500 feet, an altitude necessary to clear the mountain ranges below our direct flight path to our destination, the highest point along the route being at 10,180 feet. PIC and passenger were wearing oxygen cannulas. Skyview's auto-pilot was engaged during climb out from UT9, was disengaged during descent to pattern altitude at destination. Heading was initially 170°M, then 174°M, then 176°M. No turbulence was experienced, 10 sm + visibility, cloud ceiling above us at 14,000 ft MSL, no traffic encountered along the way, visually, on ADS-B through Skyview and on Garmin GDL52R / ForeFlight. From take-off until final approach to KBCE, the flight was smooth, uneventful. At 07:42 UTC-6, after clearing the last mountain range before KBCE, ASOS became available and its info was acquired, a descent down to pattern altitude was performed, our position to the northwest of the field and intention to cross at midfield for entry into the left downwind for runway 21 were announced on CTAF. There was no traffic in the pattern, airfield, area. Announced and entered downwind for 21. When parallel with runway 21 piano notes, power was reduced, flaps were set to full, descent angle and throttle were adjusted to maintain 58 – 60 mph airspeed. Announced and turned onto base, announced and turned onto finals for 21. At 07:50 UTC-6, while on finals for 21 with a rising sun behind the aircraft, a long shadow of the aircraft appeared in my field of view at my 1 o'clock that grew larger as descent progressed, making it appear as though the aircraft was closer to the runway surface than my estimate looking down the runway suggested. I slowed down my descent rate twice, flared, adjusted the aircraft's attitude for a 3-point tail-wheel landing, floated the aircraft until it settled down. The aircraft bounced once on mains (29-inch tundra tires at 8 psi, aluminum landing gear). When the main gear contacted the runway surface again, directional control was difficult to achieve. Despite countering rudder / tail wheel inputs, the aircraft oscillated strongly. The aircraft was heading towards the gravel sidebar that flanks the north side of runway 21 and a long hedge of 3 to 4-foot-tall bushes beyond that gravel. I was not confident that I could regain directional control with further input to the tail-wheel or efficiently brake in the gravel to bring the aircraft to a stop before reaching the hedge of bushes. I immediately applied full power for a go-around. The aircraft became airborne, but part of the landing gear (and propeller?) clipped the top of the bushes. The aircraft stalled, pivoted back towards the runway. Main gear touched down in a nose down attitude, the nose and right wing made contact with the ground and the aircraft came to a stop on the gravel sidebar. My passenger and I were not injured. We promptly exited the aircraft, I returned a call to USAF Rescue Coordination Center to cancel the ELT alert, spoke with Christine (NTSB) and Belinda (ROC). Christine released the aircraft for movement off the runway to a parking position on the ramp.		

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

Given the altitude at KBCE (7589 ft) and associated higher stall speed, the uncertainty concerning the assessment of height above the runway surface introduced by 1) the width of the runway (75 ft) that removes runway edges from the long view down the runway (edges that I see when landing on the 25-foot wide runway at UT9), and 2) the aircraft's shadow appearing on the runway suggesting the aircraft is closer to the runway surface than it actually is, leading to potentially premature attempts at arresting descent:

I could have performed a power-on landing for a longer, shallower descent at a constant speed during flare and float, and touched down on mains in order to avoid the possibility of reaching stall speed during a longer than expected float. I could have also picked another section of this long runway that was not lined with solid objects as my touchdown point and deceleration zone to provide an area where a go-around not aligned with the centerline of the runway could be successfully executed.

Since the winds were calm, I could have also landed in the opposite direction, on runway 3. I have two thick sun visors in the cockpit that I use when I take off or land into the sun. When the visors are positioned on top of each other in my field of view, and with my sunglasses on, I can clearly see the texture of the runway surface without being blinded by the sun. My sunglasses have reader portions that are not tinted, allowing for a clear view of my airspeed indicator while staring into the sun.

Finally, I had two hours of fuel reserve. I could have delayed landing, orbited the area until sun was higher in the sky or behind a cloud.
