Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Complete Hull Loss - wing and tail separated from airframe. Engine dislodged from engine mount.

The aircraft came to rest upright but suspended by the parachute shrouds with minimal damage. After coming to a complete rest and several minutes passing, the tree branches gave way and the aircraft fell to the ground inverted and the damage was sustained at that time.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I made a standard Departure from Shelter Cove Airport (0Q5) in clear VMC conditions around 1:15 pm pacific standard time. This airport is right on the ocean and upon departing from runway 12 you are climbing over the ocean, then turning slightly left towards the coast. After establishing a climb and being around 2000 msl I turned off the fuel boost pump. Once I had reached approximately 2,600 feet msl, and was just about to cross over the shoreline there was a loss of engine power. I pitched to best glide and maneuverer towards the lower terrain as an ocean landing would be extremely hazardous. I switched tanks (I believe from left to right) and activated the boost pump. I adjusted the mixture and throttle to see if that would make a difference, with no change in engine condition. I believe I may have switched tanks again, but at that point having maneuverer to the lowest terrain and the canyon area versus the ridge line, I made the decision to activate the aircraft parachute over land versus returning over to ocean. I briefed the passengers and the deployment went as expected with a nose down initial restrain, and then the line cutter activated and the aircraft righted itself to a more nose level attitude.

I turned the ignition and master switches off, and placed the fuel selector into the off position.

At some point during the events, I recall seeing what appeared to be a vapor coming from left wing around the middle of the aileron, far outboard from the fuel cap (which I confirmed were both installed and latched), and the vapor trail was not at the wing tip.

The Cirrus has a low fuel warning light (yellow - on the left hand side of the panel). At no time during the flight to Shelter Cove the day before or during the departure from Shelter Cove did that yellow warning light activate. In my past experience you have more then 30 minutes of fuel available in the low tank after that light activates.

The aircraft descended under the parachute canopy, initially coming to a complete rest suspended in the trees fairly high off the ground. After being static for several minutes we heard the tree branches start to break, and then the aircraft flipped over and fell to the ground upside down. We were able to exit the aircraft at that point.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

no known recommendations at this point.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

apparent loss of engine power, unknown cause. Possible mechanical issue with fuel system? a white/clear liquid or vapor was observed at some point coming from the area of the left wing aileron.
