Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)***Details of Damage:**

Prop strike, damaging the prop.

As it went over it hit the right wing tip breaking the fiberglass tip and denting the leading-edge corner.

The force of the nose digging into the ground wrinkled parts of the fuselage from the firewall to the cockpit.

The aircraft mostly landed on the canopy bow, breaking the canopy, denting the bow, and the force of the impact on the bow caused damage to the fuselage.

The aircraft also hit the tail, damaging the top of the vertical stabilizer.

There was no mechanical failure or damage to other property.

**NARRATIVE HISTORY OF FLIGHT** *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I took a flight, midday, for the purpose of practicing landings on my private grass strip. It was a sunny, clear day with no wind so a perfect day to be out flying. My airstrip is a grass/dirt strip 2000 ft long and 120 feet wide. It is smooth, well-groomed and in good condition. It is on the rolling plains bordering the Missouri River with a mountain one mile to the south.

I took off and gained some altitude to do some maneuvers before returning to land. My first (and last) landing was to practice a short field landing. I set up on a long straight-in approach, touched down in a nice, smooth, three-point attitude, within the first 300 ft, on airspeed, on centerline, just as planned. With the stick full back and the aircraft out of flying airspeed, I cautiously started applying brakes. On rollout the aircraft was decelerating at a comfortable and controlled rate and I was satisfied with how things were going. When the aircraft reached a slow speed the tail suddenly came up, the nose down, and I was unable to, or did not react in time to prevent the nose from continuing down, hitting the ground and flipping on its back. I shut everything down, was able to open the canopy and slide out.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The saying goes "every accident is avoidable." What is there to pass on that will help prevent others from repeating similar situations? I have flown many different types of aircraft in my military and civilian career with a good part of my flying as instructor or evaluator. I taught and believed firmly in mentally "chair flying" missions to be better prepared and help anticipate the unexpected. When transitioning to a different type of aircraft it is especially important to understand and think through the differences because the tendency in times of stress is to revert back to old habit patterns or instincts that may not be appropriate. For example the procedure for an engine failure on take off of a twin engine airplane is much different than that of a single engine. The course of action must be immediate and as a single engine failure is not safe to practice it should be repetitively rehearsed in one's mind as to become second nature.

The same holds true transitioning from a tricycle gear to taildragger aircraft. The tail dragger has its own unique challenges. The basic aircraft design and the physics behind the two are different as are the handling characteristics. In the case of this report, I did as I preach. But in trying to analyze what went wrong, I have concluded I did not analyze the last several feet of the landing roll. In tricycle aircraft braking becomes safer and more effective as you slow down. In a tail dragger, (in my case an RV8 with no passenger or weight in the back so very light in the tail) as the aircraft slows down the elevator will eventually quit flying and become ineffective as in to help hold the tail down. My instinct probably reverted to past tricycle gear experience, or possibly my feet tensed up on the rudder peddles and applied more brake rather than less; easy to do in an RV8. Or I hit softer ground, or the tail wheel hit a bump and there is no nose gear to stop the nose from going over. Regardless, had I anticipated the likelihood of this happening at that critical point, my immediate reactions would have been different. So back to my point above. Know your aircraft. Know its idiosyncrasies, tendencies, and physics behind it all. I know many tailwheel pilots that can't tell you why tailwheel aircraft are susceptible to ground looping. Don't learn the hard way.
