Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Empennage crushed, Left wing bent, prop crushed back, amphibian floats partially detached.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This aircraft had a condition inspection completed earlier in the day and this was the flight check. The aircraft had all existing fuel and oil replaced with fresh fuel and new oil and oil filter. The engine had 10 ground runs that were idle checks, timing checks, cut-off check and high power, full throttle checks. No anomalies were experienced during any ground operations. I took off at 10:52 am local time for a VFR flight using runway 32. The winds favored runway 32 and were not of concern for turbulence. The plan was to remain in the pattern and climb above the airport to check how everything was running since this airplane had not been flown for over a year and I had no time in this particular aircraft. I did a radio check on COM 1 with no response and a second radio check on COM 2 again without a response. I assume there were no other aircraft in the pattern or available to respond. I had trimmed the elevator to the center of the two markings on the overhead manual trim indicator. I powered up to full throttle position with boost pump on, prop to full fine pitch and mixture set at full rich. The engine smoothly ramped up and RPM was noted at 2750 so I reduced the prop RPM to 2690. The aircraft accelerated and with moderate backpressure on the yoke, lifted off around 100 mph indicated. Climb was noted at 600 feet per minute. I left the landing gear in the extended position since the plan was to stay over the airport. I turned crosswind when above 500 feet AGL and continued to climb while trying to trim the elevator to reduce the backpressure on the yoke. I started the turn to downwind and the engine power lowered to idle or near idle. I continued the turn so as to fly directly back to the runway 14 threshold while checking the throttle input to ensure proper position and verified the boost pump was still on. I then checked the fuel select and it was in the right wing tank position and verified the mixture control was still in the full rich position. I switched the fuel select to the left wing tank and no power was restored so I made the decision to pick a point for a forced landing. I determined that I would not be able safely to make it back to the runway due to the distance and altitude needed. I had a powerline row and highway directly in my path and I felt if I tried to make it over them I could stall or endanger the traffic on the highway. I decided to pick what appeared to be a somewhat smooth area to land before the powerline row. The first touchdown was abrupt but level and controlled then it felt as if I became airborne again very briefly before the second landing which turned into tumbling to the resting point upside down. The pilot side door easily opened and I was easily able to unbuckle and exit.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Maintain a closer distance to the airport.
