Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft crashed into Bench Lake #2 and submerged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I flew N21BH from the North Fork Helibase to the Bench Lake fire and conducted a recon before landing at the Stanley Helispot. Total flight time was 0.6. I launched to conduct aerial suppression efforts with a 50' long line and a 120-gallon bambi bucket that was cinched to 80%. I had 463 lbs of fuel on the aircraft when I lifted. I performed 29 bucket drops and felt good about the operation. Wind was light and variable for the first 29 bucket cycles. I kept watching my MGT and torque gauges. MGT was my limiting factor during this operation. Out of the 29 buckets, 25 were clean wind, four buckets indicated a wind change. This was noted by 25 buckets the MGT not reaching the start of the 5-minute limit. During roughly four buckets, the MGT went to mid-range on the 5-minute limit, indicating to me that I had a wind shift of some sort. In those cases, I slowly increased altitude, then gained a comfortable airspeed. Approximately 1 hour and 20 minutes for the first 29 buckets. With fuel at about 225 lbs I returned to the Stanley Helibase for fuel. I felt very positive about the operation.

I returned to the Stanley Helibase. I refueled with the intent to have a fuel load of 450 lbs. When I departed to return to the fire, I noted I lifted with 439 lbs of fuel. Upon returning to the fire, the fire had grown significantly. I called dispatch to provide them with a size up. I informed them they would need additional air assets and that I would not be able to put the fire out. I also called the IC who was climbing up to the fire and told him that same information. I told the IC that I would do what I could to minimize the growth of the fire, but I would definitely not be putting the fire out. The winds had picked up some, as noted by the smoke from the fire and the ripples on the lake. The wind direction was still consistently from the West, Northwest and generally down the lake. I entered my bucket circuit and was just trying to keep the spot fires at bay. At the time of the accident, I had approximately 325 lbs of fuel on board and I believe I was on bucket number 13 of the 2nd fuel cycle. I was conducting a left downwind approach just like all the other approaches from operations that day. On the final approach, I experienced a wind shift or down draft which initiated a rapid rate of descent. I increased the collective to resolve the issue, but I was unable to arrest the descent. The aircraft's rapid rate of descent resulted in the bucket contacting the lake and initiating a dynamic rollover. The aircraft hit nose down and began sinking. I unbuckled my seatbelt and egressed the aircraft. I inflated my PFD, swam to shore, called 911, and was able to join up with the IC and walk to safety.

For the first couple of dips in the first cycle of bucket work I tried dipping on the East end of the lake. There were campers on the East end of the lake, and I did not feel comfortable over flying them and working close to them. I found a submerged large rock farther up the lake and started utilizing that area as my dipping area.

I would pick from the lake, gain altitude then airspeed. I would approach the fire, dropping the water into the wind or with a slight right crosswind. I chose to accept a right turn downwind after I dropped the water because I had the ability to gain airspeed from altitude and had more clearance from the higher terrain. I had less clearance if I tried to make a left turn. As I made the right turn, I rolled out on a left downwind to a left base over the water to approach back into the wind for final and dipping. This pattern was in a figure 8 and gave me the best clearance, airspeed, and altitude options.

I settled into this flight path after discovering the campers and adjusting down the lake towards the submerged rock. Thus, I utilized this pattern for most of my dips and drops during the first fuel cycle and continued the same pattern for the second fuel cycle.

I always noted the difference between airspeed and ground speed as I turned downwind...normally that showed a 20 kias difference. I always noted the waves on the lake. In most cases the lake appeared calm on the west end and wavy on the east end. A few times during the downwind I noticed a variation in the waves on the lake that looked different, less defined and a little more erratic.

See sketch attached.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Brainerd Helicopter Services Inc. (BHSI) has an accredited Safety Management System under the FAA Volunteer program. Investigations are a key component to our safety risk management and safety assurance processes. When the aircraft is recovered, we will complete our investigation and move forward with any recommendations, changes to existing control measures, or the need for additional control measures.
