NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Background: Wife, dog, and I were taking a weekend trip from home city, Alamogordo, NM to Santa Fe, NM. Route of flight was KALM - F37 (stop to refuel) - KSAF. Accident flight departure time was 13:04 MDT and the accident flight was preceded by an uneventful, 0.5 hour flight from KALM to F37. No issues found with engine, aircraft, or weather on the first leg flight from KALM-F37. On first leg mission planning and aircraft checks, checked oil and added one quart for a total of 7 quarts of oil in reservoir. Weather was VMC, calm winds, clear, and no precipitation on first leg. No observation reporting is available for F37 so used closest airfields, KALM and KHMN, along with radar and KSAF/KABQ forecast to determine weather at F37 before first and second leg. VMC arrival confirmed clear weather. The airport environment was flat and reflected a desert like, flat terrain. Foreflight was used for all mission planning to include weather and fuel planning.

Narrative: Once stopped and refueled at F37, weather from mountains was starting to shift towards the airfield. Clouds were not yet over the airfield, probably 15 NM east still, and winds were still calm, under 5 knots based on wind cone. After refueling, performed normal oil/fuel/preflight/and before engine start checklists. Once engine started, verified all engine gauges read nominal, then chose to taxi for full length runway takeoff on runway 24 due to light trickle rain starting. Visibility was still clear, clouds were still to the east, approximately 5-10 NM away, and winds were still 5-10 knots approximately 30-45 degrees off the nose based on the wind cone reading. Once pointed down the runway at the first 50 feet of the runway approach end, executed magneto and final engine checks, verified flap and trim configuration, looked at wind cone to determine intensity and direction (right quartering and first detent up indicating approximately 5 knots still) and verbalized to my wife if she was ready to go. After she confirmed, I smoothly brought power up. Takeoff roll checks included verifying airspeed increasing, fuel pressure nominal, manifold pressure nominal, oil px nominal, and engine stacks nominal on digital engine analyzer. Aircraft rotation was nominal and initial climb was nominal with both airspeed and altitude increasing. At approximately 50 feet from the ground, noticed left wing drop aggressively followed by abnormal left yaw in aircraft. Runway was no longer in view from canopy due to being near departure end. At about the same time, aircraft immediately started to descend in altitude and aircraft control was extremely difficult. Focus was on straightening the aircraft and trying to max perform the climb out of a perceived intentional downward pull toward the ground caused by a weather event, likely a downburst. Approximately 10-40 feet from the ground, decided to accept the forced landing due to what seemed like a high VVI based off of outside references and altitude crosscheck and prioritize straightening the nose and minimizing descent rate. This was done by easing on the yoke considerably to be able to straighten the wings while kicking the rudder to straighten the nose. Just before hitting the ground, pulled back smoothly, but quickly on the yoke to try and arrest the descent rate as much as possible. Landing was very firm, but possibly good enough not to receive damage to the aircraft because the aircraft continued to roll after touching down approximately 1/2 mile from departure end of the runway. As the aircraft continued to roll, throttle and mixture were brought back to shut down the engine. During the ground roll, the aircraft went through two wire fences with the poles of the fence penetrating the wings. The aircraft skid 90 degrees to the left upon the last moments of coming to a stop. The key was removed as my wife and dog executed an emergency ground egress and then I followed, getting away from the aircraft. The police were called shortly afterwards.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

When near mountain terrain, allow weather cells to pass, even if they are 10-20 miles away. At airports without any weather reporting data, utilize the wind cone for trend data, not just instantaneous data, and consider utilizing a long period of time, 30 minutes minimum for that trend data.
