Tailboom damaged aft of attach point.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I Departed single pilot at 15:33 from (46° 7' 37.5132" -122° 32' 10.3122") Direct OR72, Boring OR. At 15:50, straight and level 100 kts 1000 ft AGL, the main rotor began a severe vertical hop without any flight control input. I immediately lowered the collective to make an emergency landing. The vertical hop was so severe I could not read the instruments. I was convinced the rotor or transmission was going to separate from the aircraft during the decent. The hop lasted 5-7 seconds and began to subside when I began to increase the collective and started a left turn for landing. By 300 feet AGL the hop completely subsided and I was able to perform a normal approach to a hover and conduct a normal landing along side a gravel road. Before shutting down the aircraft, I moved the cyclic in a circle to assess the controls and noticed it took extra pressure to move the cyclic forward. After shutting the aircraft down, I got out to inspect and found that the tail boom sustained substantial damage in flight due to the vertical hop. I noted that the horizontal elevator control rod being displaced inside the damaged and sagging tailboom is what caused the increased pressure required to move the cyclic forward during my flight control assessment. I then secured the aircraft and called the Director of Operations to report.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

I have never experienced or heard of an inflight phenomena such as this in my 25 years as a helicopter pilot and 32 years as an A&P/IA. There is nothing that I would have done differently to prevent this accident from happening with the information and training I had received prior to this flight. After some research I discovered that other pilots have experience the same issue with these same Van Horn main rotor blades on similarly configured Bell 206 Longrangers. From this research I have been made aware of a flight maneuver that may or may not have allowed me to lessen the severity of the hop. However, this information was not passed along to our company when we purchased these blades from Van Horn a few months ago. The following links describes other examples of what I experienced.

<https://www.pprune.org/rotorheads/650214-van-horn-blades.html>
