Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

- Nosewheel sheared off upon landing, it initially sustained damage from striking a runway sign during takeoff prior to final landing.
- Fuselage crumpled during final landing in the soft grass/mud. Fuel was leaking from the fuselage due to complete detachment of the nosewheel and damage to the fuselage.
- Both propellers sustained damage and were significantly bent.
- Runway sign was destroyed by the aforementioned nosewheel strike during takeoff on the botched touch-and-go.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departure time: approx 11:50L from KTIW. No services. Destination was KTIW after two touch-and-goes.

Terrain: forest about 100-150m from the west edge of the runway, normal grass around the runway with some variation in terrain before the treeline (ditches, bumps, etc). Treeline approx. 480m past the end of the runway with a sizable cliff at 570m that leads to the Puget Sound waterline at roughly 600m.

Copied from my written report for the FAA:

Pre-solo:

Before the planned solo, my instructor (Austin Mix) and I conducted a weather briefing before stepping to the aircraft (N6750H) to begin pre-flight procedures. Pre-flight procedures were normal with no issues and we taxied off to begin our planned three touch-and-goes and one full stop. Taxiing, run-up and takeoff were uneventful. I flew the pattern comfortably and the three touch-and-goes were also uneventful. My instructor gave me a couple last-minute tips based on the conditions of the day, but nothing fundamental. We conducted our full stop, I turned off the airplane, and my instructor exited.

Solo:

I restarted the airplane per the checklist. I listened to the weather report again, which was still on information "Mike". I then began my taxi and run-up with no issues. After waiting a bit for traffic, I was cleared for takeoff and I began my flight. My takeoff and first lap around the pattern went well, and I set myself up for my first touch-and-go comfortably. Austin filmed my first landing, and besides landing a bit flatter than I wanted, it was safe and smooth and I took off again with no issues.

On my initial climb for the second lap, tower called a new barometric pressure (29.70 I believe, but I'm not sure I remember) and I changed all of the pressures on my avionics promptly. Coming around to my base turn, I was still flying comfortably - if slightly high. Coming into final, I was aware of this, and worked to adjust accordingly. I put in increasing amount of flaps and pulled power as I approached the runway and I got my airspeed to the desired 70-73 miles per hour (6750H uses MPH instead of knots). During this time, I was still a bit higher than I preferred over the runway numbers. As I pulled the throttle to idle, I kept the nose pointed down as I approached ground effect. I likely leveled out a bit too high, and I over-corrected by pointing the nose down and picking up a bit more speed than I wanted. I flared and landed, and I retracted flaps/pulled carb heat. As I reengaged the throttle, I pushed it in more aggressively than necessary and the aircraft immediately pulled hard left due to its left-turning tendency. I believe I landed slightly left of the center line, so I was already closer to the left side than I wanted. Additionally, I think (perhaps subconsciously) I was nervous about the wet runway causing a skid so I didn't introduce enough right rudder to counteract the left turn. I understood the emergency procedures in this situation would be to apply brakes and stop the aircraft, but I was rapidly approaching a runway sign at 60-65 MPH and, wanting to avoid a head-on collision, I pulled

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)***Operator:**

Firstly, I should have gone around. I was higher than I should have been and going around to redo it would have been the correct move.

Secondly, I should have been far more gentle with the throttle when I re-engaged it. When the left turning tendency "kicked in", I shouldn't have been cautious with the wet runway and heavily applied right rudder.

I believe I need more training with an emphasis on fixing less-than-ideal situations and working through emergencies. Before I conduct another solo, I will be retraining as many landing scenarios as possible and will retrain intensively on all of the emergency procedures and checklists.

Solo:

I restarted the airplane per the checklist. I listened to the weather report again, which was still on information "Mike". I then began my taxi and run-up with no issues. After waiting a bit for traffic, I was cleared for takeoff and I began my flight. My takeoff and first lap around the pattern went well, and I set myself up for my first touch-and-go comfortably. Austin filmed my first landing, and besides landing a bit flatter than I wanted, it was safe and smooth and I took off again with no issues.

On my initial climb for the second lap, tower called a new barometric pressure (29.70 I believe, but I'm not sure I remember) and I changed all of the pressures on my avionics promptly. Coming around to my base turn, I was still flying comfortably - if slightly high. Coming into final, I was aware of this, and worked to adjust accordingly. I put in increasing

amount of flaps and pulled power as I approached the runway and I got my airspeed to the desired 70-73 miles per hour (6750H uses MPH instead of knots). During this time, I was still a bit higher than I preferred over the runway numbers. As I pulled the throttle to idle, I kept the nose pointed down as I approached ground effect. I likely leveled out a bit too high, and I over-corrected by pointing the nose down and picking up a bit more speed than I wanted. I flared and landed, and I retracted flaps/pulled carb heat. As I reengaged the throttle, I pushed it in more aggressively than necessary and the aircraft immediately pulled hard left due to its left-turning tendency. I believe I landed slightly left of the center line, so I was already closer to the left side than I wanted. Additionally, I think (perhaps subconsciously) I was nervous about the wet runway causing a skid so I didn't introduce enough right rudder to counteract the left turn. I understood the emergency procedures in this situation would be to apply brakes and stop the aircraft, but I was rapidly approaching a runway sign at 60-65 MPH and, wanting to avoid a head-on collision, I pulled back on the yoke and took off. The nosewheel clipped the sign and caused damage to the aircraft, as well as completely destroying the sign. While airborne, I briefly considered going around to attempt a landing, but the alarms and damage (aircraft was shaking and rattling) made me realize I had to land before going too far and potentially crashing into the water or trees. I called the tower and reported an emergency before pulling power and steering over to the end of the runway. I touched down on the runway at about a 45 degree angle about 5/6 of the way down the length of it. I rolled into the grass for about 25 meters until the nosewheel collapsed and the aircraft's nose dove into the dirt/mud and came to rest. Both propellers were bent, the nosewheel was sheared off and the front of the fuselage was crumpled. I called the tower, told them I was fine and that I was exiting the aircraft after turning it off. There was fuel leaking from the fuselage so I waited for a response from a healthy distance.
