Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

The wings were severely damaged and bent rearwards but remained attached. Rear window was smashed by the extended flaps. Nose gear was collapsed rearward. Forward lower left side of the cowl was dented and damaged. Upper cowl appeared to have been pushed up and back slightly towards the cockpit.

Multiple trees were impacted and damaged in the landing including a wooden fence between two yards.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The student and I arrived at the airport (KEMT) at 0530 PST. The plan was to spend the lesson in the pattern for landing practice. During the walk to the hangar we discussed a possible low fuel situation with the aircraft. The self serve fuel was out of service and the FBO selling fuel would only open at 0700. I commented that if we had at least 7 gallons we could go. On preflight the airplane was found to have exactly 7 gallons, measured with the dip stick. 3 gal on one side and 4 on the other. Based on previous flights and fuel burn, I calculated this to be an hour and half of flight time, and decided we could fly for an hour and still meet reserve. After some ground lessons we fired up at 0650, and took off at 0657. We first departed the airport for a simulated pattern and then returned for pattern work on RWY 01 at KEMT. We did four patterns with four low approaches followed by a fifth pattern with a touch and go. On climbout from the touch and go the engine momentarily lost power. We were at approximately 300 ft AGL. As it regained power I realized we were likely running out of fuel. I checked the time and it was 0757. I immediately took controls from the student and turned left back towards the airport. As soon as we began the turn, the engine lost power again. I pulled carb heat just in case but was quite certain that it was a fuel issue. I determined that we couldn't make the airport and lined up on a road in a neighborhood. As we descended for the road I saw power lines in our glide path. I dove the plane underneath them, and as we passed beneath them the engine suddenly regained full power for several seconds. We climbed back up to about 75' AGL before the engine lost power for the last time. The road was no longer a good landing option and I turned slightly left towards the best spot I could see, which was a backyard between several houses with multiple trees. The last time I looked at the airspeed it was indicating 50 MPH. We passed just over one house and then clipped two trees one on each wing before descending into the yard and striking another tree with just the right wing. This pulled us to the right and through a fence and into a final bushy type of tree that stopped us. The aircraft ended up suspended in that tree with the nose of the aircraft coming to a stop just a few inches from the house ahead of us. Neither house was impacted in the landing. The whole deceleration happened in a span of only 65'. The doors were both jammed by the tree, but we were able to open a window enough to climb out the co-pilots side. Both of us were uninjured. It was truly a miracle. Praise God.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

This accident could have been prevented by a correct understanding of the fuel dip stick. I believed that I was measuring usable fuel, when in fact it was total fuel. The aircraft has 3.5 gal of unusable fuel, 1.75 gal per side. This would explain why the engine lost power at exactly one hour into the flight. With 7 gallons total we would have only had 3.5 usable, about an hours worth of gas for the type of flying we were doing. On a previous flight two days before the aircraft had burned 8 gallons over 2 hours of flight, so 4 gal an hour, during similar training.

I wrongly assumed the dip stick to function and measure as I was accustomed to in the past. The dipstick itself does state that it measures 13 gal total. If it were measuring usable fuel it would have indicated a maximum of 11.25 gal. I think my lack of familiarity with the airplane as well as my wrong assumption allowed me to miss this clue as to what the dip stick was really measuring.
