Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

The aircraft's right wing and right elevator made contact with the runway. The right wing is bent slightly up starting at the strut. The right wing tip is bent at a slightly higher angle than the center section of the right wing. The right elevator is bent upward starting at the outboard hinge.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the morning of 26 March 2025, I prepared to make a cross country flight from KDLS, Columbia Gorge Regional, to S33, Madras Municipal, and back to KDLS in N1418C, a PA-22/20. At the time of my preflight the S33 TAF was forecasting light winds out of the south until sometime between 1100 and 1400 (all times PDT). Alternate weather sources (windy.com & NWS hourly forecast) forecasted winds to become strong and gusty at S33 between around 1400. I intended to land at S33 between 1005-1015 and depart S33 no later than 1030.

I departed KDLS at approx 0905. At approx 0935 I tuned in AWOS for S33 which was reporting winds of 016@5. Checking foreflight, the S33 METAR was reporting winds Calm. I tuned to the Madras CTAF and took note that traffic was using runway 16. I continued to alternate between monitoring the CTAF and AWOS as I approached the field. At approx 1005, and approx 10 minutes from touchdown, I listened to the AWOS one last time before transition to the CTAF for the remainder of the flight. At 1005 winds were reported 015@6. I continued to a point approx five miles southeast of the field where I turned to make a 45° entry for the downwind for runway 16. As I was approaching the downwind, I made a right 360 to establish spacing between myself and another pilot in the pattern. Upon entering the pattern my downwind and base legs were normal. On final I found that the wind was stronger and gustier than expected. I found myself using additional power and making a crosswind correction to the left. As I was approx ten feet above the runway I set up for a three point landing. I touched down at approx 1015. Once on the runway the aircraft rolled for approx two seconds before the left wing began to rise and the nose started to turn to the right. Very quickly the aircraft turned 50° to the right and tipped up onto the right wing. The aircraft then came to a rest on all three wheels. I taxied to the ramp and observed that the wind was now strong and gusting out to the SE.

According to a NWS historical weather product for S33, winds increase from 7kts out of the south at 0955 to 16G21 out of the South at 1015.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Corrective/Preventative measures include:

- Choosing to go around when winds of a higher intensity than expected were observed on final. This would have allowed for a check of the AWOS while in the pattern.
- Applying increased cross wind correction when in the flare and on roll out.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
