NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 1/19/2025 at approximately 5:15 PM. I departed KSOW on runway 25 for a reposition flight to 5AZ3. This approximately 100 nautical mile 35 minute VFR flight was flight planned with a cruise altitude of 12,500 AGL. I did GPS direct and used a 2.2 degree descent profile for a target 2500 AGL pattern altitude 4NM from 5AZ3. There would be no class bravo airspace to contend with as I would be only under the 90/70 shelf. I picked up ATIS from KIWA for altimeter and winds. The planned landing runway would be 26 with an extended runway heading dog leg needed. I did several 123.05 CTAF announcements and attempted to turn on runway lights to better identify the runway. There was significant glare from the setting sun at this time of day. When approaching the extended dog leg entry what I thought I had identified as the runway I started my descent into what I thought was the airport environment. When I caught powerlines directly in front of me, I decided the best course of action was to descend down and go underneath, and then felt a thud. I immediately added power, retracted my gear and flaps and climbed. The aircraft felt completely normal during the climb. My next decision was where to land, I absolutely never considered trying 5AZ3 again given what just happened. After leveling off at roughly 2500 AGL I could now hear a different sound out of the ordinary (wind noise). Because the plane was flying normally I chose KFFZ because it was most familiar to me. I flew a normal approach into the airport environment and treated it like a normal landing. I was asked to extend my downwind for traffic and did so. In landing configuration over the runway at I believe around 80 knots the plane rolled hard to the left, with some correction I was able to get the aircraft on the ground and use a combination of differential braking and the spring input from the rudder controls to stay centerline and exit the active runway.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

A pass 500 feet above pattern altitude over the airport to positively ID the landing area.
