Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Power lines arced and severed 3 suspension cables

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Forecast for the morning was winds variable 3-4 until noon. Launch went smoothly with a small increase in forecasted winds to maybe 5mph.

Predominant wind direction was expected to be from the east toward open ground to the west. This is a common Katabatic flow where the cold air from high country in Zion's National Park to the west, flows gently to the east until the sun heats up the ground and stabilizes the flow.

The winds took us north along the Hurricane cliffs and towards congestion. This generally not of big concern as balloons routinely land in congested areas.

As this was a Commercial check ride, the applicant was PIC. Any intervention by me, the DPE, would have rendered the check flight terminated. I would not have hesitated to take over if I felt the conditions were beyond the applicant's ability or if any other situations occurred that would create an unreasonable flight risk.

In going through the required PTS maneuvers with the applicant, it was clear that he was well prepared and very skilled throughout the process. Quite often applicants will get behind the power curve a little or finish a steep descent with a large rebound. He did not exhibit any of those issues. He maintained excellent control throughout the hour of flight leading up to the power line strike.

The terrain immediately before the line strike was a deep canyon (Virgin River) that flows from the east into a large, wide open abyss. The winds had picked up to around 10mph at this time and we were maintaining a low flight profile as it is crucial in those conditions to be ready to land if an opportunity arises. The applicant's level flight control had been flawless and he continued to maintain a reasonable (landing ready) altitude as we approached the canyon. I asked him if he could make a dive into the canyon and try catching the far edge of the canyon with the basket to slow a bit and rip the top out for landing as there was a flat open spot. He made descent but just missed the other edge so he aborted the landing. (This maneuver required advanced skills in order to fly the balloon down below the canyon wall and quickly reverse to an ascent and try to catch the lower part of the basket on the far edge to slow down and stop the balloon within the boundaries of the open area.

The applicant realized quickly that we weren't going to make it and burned out successfully. We remained at about 150' above cliff edge level as we flew along the cliff over the deep abyss. The cold air coming out of the canyon into the abyss, created some additional buoyancy (In retrospect). It was very subtle additional lift but constant. As we flew to the far edge of the abyss, the balloon suddenly went from level flight to a downward angle. Having double burners on this balloon, the applicant had already started burning. I quickly reached up to start the other burner but I found he already had both of them engaged. Given the angle of attack (On a descent to a point below the wires about half way down the pole), I immediately instructed him to "rip" (ie pull the vent vigorously to dump air). While I have never had an accident or hit power lines, this is a fundamental axiom in ballooning: "When in doubt, Rip it out" which is what the applicant did. The logic being you will survive envelope contact with the wires but you may not if the basket contacts the wires.

For reference, there were 2 other pilots flying in Washington, UT about 10 miles away. They commented that they too experienced significant downdrafts that morning. I can provide names and phone numbers if you'd like.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

In hindsight, I have given a great deal of thought to my behavior during this accident. As an examiner, I am not allowed to assist or intervene with an applicant in a checkride or the check is immediately over. In this situation, the applicant had carried out a flawless flight conducting all the required maneuvers satisfactorily (Very well I might add). There are always possibilities for downdrafts associated with higher wind speed over mountainous terrain. Burn timing is critical in situations like this. When you are not operating the burner, and someone else is, you lose a level of "burner response and feel" which is essential for precise control especially when sudden turbulent conditions occur. I felt that the applicant started the burn sequence timely when he noticed the downward push. However, when this occurred, the proximity to the wires left few choices. It's possible that the balloon might have responded with the burns in time to miss the wires completely. On the other hand, contact with the wires anywhere on the 8' tall basket could have likely been deadly. Given these same circumstances, I would rip out every time.

The only thing I might have changed is whether to intervene if conditions become complex regardless of the demonstrated skill of the applicant. In this case the applicant would have passed the flight check had we landed safely. I was reluctant to take over when he had demonstrated great decision making and skills. As an examiner, I am now wondering if intervention is wise in unexpected conditions even when the applicant is doing well.

I've been a balloon examiner for around 35 years and have allowed applicants to complete flights (unless they demonstrated unsatisfactory performance) in deteriorating conditions. It's actually good experience most of the time. I will continue to wrestle with this and plan to discuss this with some of my fellow DPEs

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
